Recently, Bob Witte, KB0CY, asked about the apparent absence
of FM in VHF contests. Here are a few comments:

1. FM is not very popular in VHF contests EXCEPT in California, where it is the main mode on 2m, and almost the only mode on 220 and 432 (woops- 223 and 450).

2. About 10 years ago, the VHF contest rules permitted unrestricted simplex FM activity. A few of the Big Gun multiops abused this rule and "took over" the most popular simplex channels in metropolitan areas. Consequently, stiff restrictions were eventually placed on FM operation (no 146.52, for example) so the FM people who wanted to communicate could do so without contest QRM.

3. Most FMers prefer repeaters and seldom spend much time on simplex. As a result of the fact that contest stations can't solicit QSOs on repeater frequencies, FMers may not be aware that a contest is in progress.

4. They may not care. Many FM-only (or FM-mainly) stations could not care less about contesting. So it's only fitting that they should be left alone. I think the FM restrictions are pretty reasonable.

What is the current version of the K1EA software? Is it universal in being able to handle VHF contests as well as the HF ones?

> useful for you to tell him that he is out of the ham radio mainstream - why
> didn't you point out the two-part feature article on 903 MHz linears?
> At least it was above the antenna-switch technical level.

Well, I say what I think. Sometimes that happens to coincide with the "company line." If I remember right, the posting was about the microwave column. I've mentioned in several recent postings that there are other things published by ARRL--including feature articles--that IMHO more than make up for the loss of that column. Guess I should have said so in that response, too.

> **** SOAP-BOX MODE "ON" ****
> Many of us DO feel that QST should have at least ONE article above the lowest-
> common-denominator level (technically) each month. There is a claim

What's your definition of "lowest common denominator?" Looking over the past few months, I see a two-part article on 902-MHz power amplifiers, a two-part article on a PC-based weather satellite receiving system, an analysis of aurora techniques, an article on short top-loaded verticals (including--gasp!--integral equations), and an article on CP quagis for satellite use, among others. Now, none of those is breaking new technological ground, I'll grant you, but aren't they at least above the lowest common denominator?

> that QST is a publication for ALL HAMS... Don't leave out the 5 or 10% with
> some slight technical background. Twelve articles transplanted from QEX
> each year couldn't touch all the special-interest higher-tech aspects of
> hamdom - BUT THEY COULD ILLUSTRATE TO THE NON-HAM WHO PICKS UP QST THAT THERE
> IS STILL SOME TECHNICAL CONTENT IN HAM RADIO. I share your view that articles

A good point, although I'm not sure who you are trying to get that message to. If it's the man on the street or the high-school kid, the present content of QST is sufficient to overwhelm them technically. If you are trying to impress the professional engineer, I think we'd have to go a lot further than you suggest. But maybe non-ham electronics hobbyists would be drawn in by more technical content.

> are more valuable than monthly non-news special-interest columns. Is there
> ever any real info in Rip's satellite column? I think the complaints against

Well, Rip doesn't do it any more--see the title block on p. 68 of your June QST.

> "Nobody ever went broke underestimating the intellect of
> the American public". Does our national ham society's journal have to
> follow this rule so closely?

Come now, Bob. It's not like it was the New York Post or the National Enquirer. I'd like to see more techninal info in QST too, because that's my particular interest. And who knows, if enough people express an interest in having more technical info (and if it's submitted for publication), maybe it'll happen.

The cost of school is such that I am going to have to get out of ham radio until I am sure that I can meet the tuition (sigh). Here's the list of my gear that I am going to have to get rid of:

Drake TX-4C/ R4-C/ AC-4.....just back (4 days ago) from being overhauled by Drake; still in the factory sealed boxes, with Drake warranty.

Icom IC-2SA....with extras, under a year old.

Kenwood TH-215A...also with extras, about a year and a half old.

Cushcraft R5....about a year old, with recent Cushcraft design updates.

I am the original owner on the last three pieces of gear; all are in very good to excellent condition, and function perfectly.

Drop me a line at gray_s@dickinsn.bitnet, or feel free to call at (717)-258-5477 anytime (I have an answering machine). Thanks!

The release version of CT is now 6.14, which was first available at Dayton. Version 6 added true multioperator support which was not present in version 5. Of course, bug fixes and other improvements are also included. CT information can be obtained by sending an SASE (or $25 for the program) to:

BILL McGOWAN, KC1EO

HOLLIS, NH 03049

>Is it universal in being able to handle VHF contests as well as the HF ones?

What do you mean by universal? CT supports the ARRL VHF QSO Parties (June and Sept), I'm not sure about January (unless it's the same logging information and scoring).

jim, AD1C

I am looking for the mod to expand the frequency coverage on the Heath HW24
dualband mobile. I have looked in the mods database, but there is no listing.
Does anyone on the net have this info? I'll take the mod info for the
handheld if anyone has it also. (all discussion about type acceptance is
duly noted) Thanks!

Paul

The mention of a 6dq6 brings tears to my eyes (oh no, guess it's just allergies). That was the final in my first transmitter.

My older handbook says:

plate dissipation 18 watts
Cin 1.2 pf
Cout 15 pf
Cgp .55 pf

Plate V 250
Grid bias   -22.5V   /*class C? */
Screen   150V
Screen Ma   2.4
Plate Ma   75
Transconductance 6600 micromhos

6.3V 1.2 A filaments

I don't think I ever ran this tube linear though I did screen modulate one for my first AM contact (Guys I worked thought I was a girl because my voice hadn't changed. Took me a couple of days to make the second QSO..)

Hope this helps...

Bob Atkins KA1GT writes:

> On the subject of technical article, submitting them is of course required to get them published, but also of great importance is the attitude of the editor of the magazine. There is probably little point in going through the effort (and believe me it requires effort) of writting a detailed technical article on say, a complete solid state 10 GHz transverter, if the editor is going to say "too long", or "too technical", or "not enough reader interest". I very much doubt that such an article would be accepted by 73, CQ or QEX. It might get into QST with enough lead time. I think our best hope for technical articles would be a new publication from the CQ stable. I'm keeping my fingers crossed.

I can tell you that it *didn't* get into QST when I gave them first option on it in 1987 (By "it" I am referring to my all band all-mode microwave station series that went into Feb/June/October 1988 HR which detailed a complete 10368 MHz transverter). They did say "too long" and "too technical".

QST suggested that it could go into QEX in a million installments. Although QEX had handled the 10 GHz filters article I did previously pretty well, I wasn't excited about a 15 part article.

On the other hand HR didn't really seem too sure what the article was about... maybe it was just my poor writing style.

I have the impression that Paul Rinaldo would like to see QEX expand a bunch and I wonder if we shouldn't consider trying to support him in this. I got my copy of CQ like everyone else and I see no particular reason that the current advertisers should be particularly helpful to articles of more technical depth. QEX at least has some of the "fringe" advertisers.

I know that a lot of us are frustrated with the current state of amateur technical publications but maybe even those of here on Usenet can have more impact than we think.

Could we possibly overcome our differences and frustration enough to actually do something in a coordinated way?

In a sense I think this question is a microcosmic view into amateur radio's future. A lot of us care and we are all different. Can we effectively work as a group? This kind of cooperation is what saved amateur radio after we lost all the "good" spectrum above 200M in the early 1900's, I believe we need it again if we are going to survive in the 21st century.

For all of those who are flaming QST and CQ for the lack of technical articles, here's a suggestion before I depart for vacation: WRITE A TECNICAL ARTICLE AND SUBMIT IT to the mag of your choice. In about 6 months, if we don't haven't noticed an increase and/or update of technical content then we'll know for sure..

In December, we'll look for a report from these folks about how many articles they submitted vs how many were published.

See, it's simple.

It was my understanding that the FCC sidestepped that issue by issuing a "group license" to all citizens and residents of the USA. If they cared at all about callsigns, they might have specified "tactical callsigns selected by users" or some such gimmick.

This is a different age, Bill. In "our day" people felt the need for the structuring and order provided by licensing and testing - rules and regs and proper procedures and all that good stuff. Today's young people especially feel comfortable in a world of semi-organized chaos.

In other words, we were born in a "Why?" world. Today's society is a "Why not?" world. I'm not saying that's better. It's just the way it is.

****
IMPORTANT NEWS FOR NEW JERSEY READERS!!!!!
****

There's good news and bad news... S-305 was PASSED by the New Jersey Senate. The bill has been referred to the Assembly Judiciary, Law and Public Safety committee. New Jerseyites are just two steps away from being able to legally use wideband receivers in their automobiles.

The bad news is that NJ's law enforcement community is complaining about the bill. I received a letter from Senator John Lynch (sponsor of S-305) urging supporters of the bill "to contact Assemblywoman Ford (Chairperson of the Assembly Committee reviewing S-305) to press for timely consideration of the bill by her committee and assure that the amendments to this legislation do address the legitimate concerns of law enforcement groups".

The address for The Honorable Marlene Lynch Ford is:

200 Main Street, Suite 2
Toms River, NJ 08753
201-240-2200

Senator Lynch attached a letter to Assemblywoman Lynch from P.O. Michael Brunson, chairman of the legislative committee of the NJ Police Traffic Officer's Association, urging ammendment of S-305. His concerns were:

- persons with the ability to receive police communications will interfere with emergency activities.

- they will try to avoid traffic tickets by ascertaining the location of patrols.

- And "many many more reasons that I could cite you and your committee" - though apparently he could not think of any at the time he wrote his letter.

I agree with Officer Brunson that anyone who uses a scanner to interfere with emergency activities should be ARRESTED. And that is exactly what S-305 provides for - misuse of radios is ILLEGAL, possesion is LEGAL. I disagree with his second point - having listened to police communications for a long time, there is little or nothing that would be of any use to speeders.

I strongly suggest readers WRITE or CALL Assemblywoman Ford TODAY, as well as your own assemblywoman.

Thanks,
Lou

I recently returned from a diving vacation in Cayman Brac (ZF9), and on the way to and from our little 8-seater plane stopped on the island of Little Cayman (ZF8). This place was so beautiful, and the diving I did there so great, that I've decided to go back with the excuse of running a contest from ZF8. So here's the question I would pose to any other contesters out there: which one should I go for? I don't see where ZF8 would be much for CQWW (you have to get through the east coast wall for Europe), but it would be a great one for the ARRL contest in February. Trouble is, the water is cold enough by February that I'd have to wear a wet suit diving. Same thing for WPX. So...what contest (and I only want to run a CW contest) happens before the end of November and would be a good one with a ZF8 prefix? Any suggestions would be appreciated.

Ugh. Ick.  Smells like politics, looks like politics, feels like
politics, tastes like politics.  Glad I didn't step in it.

Actually, this is one of the best places I can think of to argue ham
radio politics.  There's a wide, more-literate-than-elsewhere audience,
and the free exchange of ideas not only encouraged, but not crippled by
needless anachronistic impedimentia (callsigns, q-signals, morris crud,
etc.) that somehow seems to accompany on-the-air discussions.  Who
knows?  We might actually come up with a good idea or two!

Politics, you see, is what mankind evolved to replace battles.

> We need all of that we can get.
```

Well not quite ALL, I mean, would you really want, for example, *every* U.S. citizen to be licensed? There isn't that much bandwidth.

I agree, though, that moderately increasing the number of people I can talk with wouldn't be such a bad thing. :-)

> Were those folks (since they were up on a mountain...) part of a club
> or organization...

Well, not those ones in particular, but I see (and sometimes even participate in) Colorado Mountain Club trips.

> Is there a way you can arrange for a presentation at one of their
> meetings about ham radio?

Sounds like work! :-)

> Go try all the neat things you can do, and if you can do a favor for a
> friend or a stranger, let 'em know it was a HAM who did it!

Now that I can do and have been doing. Merely hiking with a radio on my pack has generated lots of comments and questions. Thinking about it, in my 13 years of Colorado mountaineering that's been a really rare sight. I mention to people that if they have an emergency (very unlikely), they should get ahold of me on up the mountain or whatever.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

Line 2

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
10-11	International Designator (Last two digits of launch year)
12-14	International Designator (Launch number of the year)
15-17	International Designator (Piece of launch)
19-20	Epoch Year (Last two digits of year)
21-32	Epoch (Julian Day and fractional portion of the day)
34-43	First Time Derivative of the Mean Motion or Ballistic Coefficient (Depending on ephemeris type)
45-52	Second Time Derivative of Mean Motion (decimal point assumed; blank if N/A)
54-61	BSTAR drag term if GP4 general perturbation theory was used. Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63	Ephemeris type

65-68	Element number
69-69	Check Sum (Modulo 10) (Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)

Line 3

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
09-16	Inclination [Degrees]
18-25	Right Ascension of the Ascending Node [Degrees]
27-33	Eccentricity (decimal point assumed)
35-42	Argument of Perigee [Degrees]
44-51	Mean Anomaly [Degrees]
53-63	Mean Motion [Revs per day]
64-68	Revolution number at epoch [Revs]
69-69	Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

```
NOAA 6
1 11416U          86 50.28438588 0.00000140           67960-4 0  5293
2 11416  98.5105  69.3305 0012788  63.2828 296.9658 14.24899292346978
```

Note that the International Designator fields are usually blank, as issued in the NASA Prediction Bulletins.

My GE handbook gives these specs for the 6DQ6-B:

Fil Volts: 6.3
Fil Amps: 1.2

Pdis (Watts): 18
Max Ep: 770 (Supply volts, Design Maximum)
Max Screen Volts: 220 (Design Max)
Max Screen Watts: 3.6 (Design max)
Cin: 15 (without external shield)
Cout: 7.0 (without external shield)
Cg-p: 0.5 (without external shield)

In Horizontal Amp service (TV):
Ep: 250
Es: 150
Eg: -22.5
Ip: 65 mA
Is: 1.5 mA
Rp: 18,000 ohms
Gm: 7,300 uMho

A note says that in this service the design maximum positive plate pulse voltageis 6,500
and the design maximum dc cathode current is 175 mA.

73,
Dube Todd

Can someone tell me how the DTMF selective call feature works
on the Kenwood TH-26AT (or TH-46AT) and the ICOM IC-2SAT?
Also, any comments pro or con on these HT's are hereby solicited.

> about full-out at HQ.

Let me see, same number of bods and 40% more members, that makes 40% more money.

So what is happening at HQ? Let the ARRL themselves tell us how these scarce resources paid for by our subscriptions (Yes, mine as well) are advancing the radio art and challenging the borders of engineering and science:

+ ARRL LETTER - VOLUME 9 - NUMBER 12 - June 15, 1990 - Page 3 of 4

+ HQ HOSTS OPEN HOUSE

+Lab supervisor Jon Bloom, KE3Z, demonstrated for visitors the League's setup
+for measuring transmitter spectral purity, with a commercial 2 meter FM
+transceiver and a Hewlett Packard spectrum analyzer. Visitors also got a
+peek at a 20 meter transceiver being designed by staff member Zack Lau,
+KH6CP, showing several stages of the development process. This rig is being
+designed for production and donation to amateur societies in third world
+countries.

We are going to pay for the third world to get free U.S. Built radios? For 20M too no less.

+ DXCC BEGINS MOVE TO DATA PROCESSING

+DXCC automation has begun in earnest, with final testing of software
+completed June 1. New applications and endorsements are entered into a mail
+log for tracking through the system. This log helps staff members quickly
+answer questions regarding the status of DXCC applications and endorsements
+in progress. On June 11 "backfilling" began--the process of entering past
+records into the computer on a priority basis. As endorsement applications
+are received they are backfilled to bring the applicant's record up to date;
+the endorsement is then processed.

I wonder how many Microwave columns in QST this would pay for? But hey gotta keep proving to ourselves that with a modern equipment it is technically possible to talk to at least 100 countries, even if some of them are uninhabited reefs. What will we do when the contesters die off?

+* Last week, a formal application for DXCC status was received at HQ for the
+Penguin Islands, a string of 13 islets off the coast of Namibia. The
+application, made by DK9KX, KC1AG, and ZS9A, indicates that the islands are
+claimed by South Africa, and propose DXCC status based on the islets'
+meeting the 75-mile minimum separation from S. Africa. It can be expected
+that the the DX Advisory Committee will require several months to
+deliberate on the application.

My fees pay to prove that more desert islands are really countries? No wonder they are busy at the ARRL, this is important stuff. We can't just leave it up to the UN to decide who and what is a country.

+ * The *RSGB Microwave Handbook Vol. 1* is the latest addition to the
+ARRL library. Edited by G3PFR, it covers microwave theory and practice in
+mostly non-mathematical language. Two additional volumes will follow. 224

+pages.
I recall a time when the ARRL produced manuals that were respected all over the world. Now we have to get the RSGB (1/10 size of ARRL) to produce books on Microwaves etc. The book probably has metric dimensions too.

Re: 200 W maximum, beam antennas

While I agree in principle (the right tool for the job and all that), there are some realities that creep in -

1. Not everyone can erect a beam. High wind is a problem. Phased Omnis take more real estate than I have. There are also those pesky covenants.

2. I can think of many positionings of 2 receiver/transmitter pairs where a beam won't help.

3. It is sometimes necessary to use >200W on 40/80/160 to get over QRN, especially during summer.

4. The use of omnidirectional antennas is appropriate to a roundtable, which is typical of 40/80.

5. Ever see an 80 meter beam on a tower ? I've seen K0RF's. It looks tenuous.

Yes, one can do a lot with antennas. However, it isn't the technology that is the problem, it's the operator. Any power in excess of that required to make the contact is illegal. We already have the laws;

where is the enforcement ? Maybe the problem is us - macho signal reports seem to be better than good operating skills.

When was the last time I asked someone to QRP ? I dunno. I'm part of the problem, too. S9+40 is real easy listening.

I dunno if it's true of the review of the loop antenna thingy discussed here, but a few issues ago there was a review of an HF amplifier in CQ, and an ad for the same thing in that issue as well. I remember noticing that the two were identical in places, as if someone had just reeled off the specs from the ad and called it a review. I remember thinking at the time that this was very poor practise, it was as if the mag had just given the guys selling the amp another page to say the same thing only not head it 'advertisement'. It may have been the same issue as the one with the loop thingy review, if anyone has more energy than I have and wants to go and check.

Interestingly, our Physics-Math-Astronomy library gets CQ Mag, perhaps a previous librarian was a ham.   I'd never see it otherwise.

According to kd2bd@ka2qhd.UUCP (John Magliacane):
>Fuji-OSCAR-12 has been heard on recent occasions by G3IOR, G3CAG and G4CUO.
>The spacecraft is apparently receiving enough sunlight to produce a weak
>battery charging current and support low-power transponder and beacon
>operations. FO-12 was switched off by telecommand last year, but apparently
>switched back on when it received commands sent to its sucessor, FO-20.

Now, wait a minute.

Does this mean that the commands to the various spacecraft are not all tagged with destination IDs?

I can imagine what kind of confusion a lack of satellite ID could, and apparently can, cause. "Retract your solar panels. No, not you -- the one with the bent antenna. Yeah, you." :-)

>Richard Gerdes, PSI co-founder, explains that their technique "alters
>the shape of the carrier and transmits the result of that altered wave
>shape."

This is called "modulation" and is what all transmitters do to convey
intelligence on a carrier.

>At the NTSC level:
>
>   PSI gas already developed a commercial product using waveform modulation
>   for NTSC broadcasts: an encoder and decoder that allows an NTSC station
>   to broadcast two channels simultaneously from one transmitter. "You
>   could tune to channel 4A or 4B using the decoder," Gerdes says. The
>   FCC has already granted an experimental license for channel 11 in Tuscon,
>   a Fox Network affiliate, to begin testing the system.
>

This technology is not new and has been used on satellite video channels
for several years. Basically what they do is break apart two NTSC pictures
and use field one from one picture and field two from the other. They then
reverse the field sequence for the next frame. Then at
the receiving end they use two framestores and a demultiplexer to
reconstruct the two video signals. As you can tell from the description,
they throw away half of each video frame. This causes some loss of
vertical resolution (though they do frame to frame interpolation which
recovers most of the resolution for stationary pictures). The resulting
artifacts are most noticable on rapidly moving video.

One thing video freaks should know is that broadcasters have expressed
a serious lack of interest in HDTV. In fact the use of minicams and
small format tape has markedly reduced the quality of ordinary NTSC
video being broadcast by networks and affiliates. The over the air
broadcaster has seen a decline in viewership in the last several years
due to low quality VCRs and poor quality NTSC cable channels being
preferred by the average viewer. The broadcaster has responded by
cutting costs to the bone by using cheaper equipment and reducing
the technical requirements for his staff. It is estimated that it
will cost over $50 million to changeover a broadcast plant to HDTV.
With no market (no receivers in place) and the loss of NTSC viewers
(estimated $120 billion invested in NTSC infrastructure) the broadcaster
would have to have deep pockets indeed to pioneer HDTV. Plus there

is no HDTV product available to fill those 24 hours a day.

Yes, I have confirmation that he was found in bed on Wednesday morning, June 20th. He was suppose to meet another ham operator on Wednesday morning. When Jim didn't show up, he went looking for him and found him dead in bed. The exact cause of death is unknown at this time. I don't know where the electric shock story came from. I heard that there are a few rumors that are already floating around...this might be one of them.

If you want more information, try to contact KA2RRK (Jerry, Ft. Dix, NJ), on 28.305 USB after 22:00 EDT if the band opens.

Well, folks, there is a greater than 50-50 chance that I will be
losing net access Real Soon Now. If mail suddenly bounces when
sent to me, my apologies, I had absolutely nothing to do with it!

It is possible that I will be reachable via telephone at my home
number (303) 673-9041, if needed. I may also move to the Phoenix
area.

I will attempt to make one final posting to the net if my access
is being terminated and I have enough warning.

Thanks, and its been REAL fun!

(This implies that we won't be doing the callsign project any time
too soon, also. Sorry about that, I'll try to get it back on track
as soon as possible.

73, and its been a blast! de rusty n7ikq (aka 'Mr Callsign Project')

In listening to the 20 meter band circus I've noticed that there are 3 problem areas:

1) The small number of American Amateur Extras that have taken it upon themselves to dictate/interpret the FCC rules to the other stations/ operators on the band. All of these jerks that I've heard have been in 4 or 5 land. Looking up their calls and relating their mailing address with a position on my map, I find none of them to be in remote or inaccessable areas - why isn't the Auxillary or ARRL pink-ticketing these individuals?

2) The large number of Spanish-speaking stations that seem hell-bent on doing nothing but jamming the DX parties. These stations never id, nor do they seem to be active in seeking contacts, or conversing amongst themselves. Most of the signals are between S9 and 40+ over S9.. ..I wonder where they are? Perhaps an inquiry with the diplomat kids...

3) The fact that the ARRL, the FCC and the Amateur Community is unwilling to take on these sour-note clowns head-on. Everyone keeps ignoring the obvious! Get 'em on tape, send the pink-tickets - if they keep it up, bust 'em! Just get a Fed Judge to issue a warrent, get a Fed Marshall (with riot gun!) to accompany the FCC Field Engineer and go serve up the warrent. Put their stupid little asses in the clink! Is that so damn difficult?! The FCC does this about 4 times a year to the worst of the CB bad-boys..why not the jerks on 20?

This is the GENESYS system that was first introduced about two years ago. As I recall, it stirred quite a controversy due to its "black magic" nature and sketchy details as to how the system worked. A lot of engineers were claiming it violated the laws of physics. I saw Mr. Geddes present a paper on the system at the 1989 NAB convention. My coworkers and I couldn't tell if it was real or snake oil. They also had a demonstration that wasn't working when I went to see it. A coworker said they sort of got it working the next day (apparently there was a lot of crosstalk between the two "channels").

At this year's NAB, another paper was presented that gave a lot more detail on the system and outlined plans for testing it on the air. This time around, it seemed more like a real system, but still had some "snake oil" aspects to it. However, the jury is still out at least until the tests are completed.

Personally, I think it would be great if the system works, but you don't get something for nothing. I think we'll have to give up something to get two video broadcasts on the same channel. Whether it's something we're willing to give up is another story.

. Would even the ARRL, which
> is a membership organization, not just a magazine, be this openly critical?
> Probably not. Ham radio sorely needs a Consumer Reports type of organization,

Anyone recall the critical review that QST gave of the MFJ Multi-Mode
Data Controller/TNC? MFJ got pissed, and made enough noise that QST
agreed to do ANOTHER review, this time of a MODIFIED unit! Of course,
in the end it had a good effect, because the same mods were allegedly
done to the production units as well....but somehow I can't imagine
Consumer Reports following up a scathing review with a more friendly
one, following acceptance of a modified product from the manufacturer!

Then there was the great review of the bogus "automatic" antenna tuner,
that achieved low SWR with big RESISTORS in the circuit....

I have been a subscriber to both CQ and HR for many years. For some reason,
CQ has always listed me as KKT7H on the mailing label. Of course, now that
the change has come, CQ is sending me TWO (!) issues per month...one with
the KT7H from HR, and the other to KKT7H.

I don't mind a folksy type semi-technical review, but the thing that really bothered me about this one was that he kept saying that the Isoloop outperformed his conventional HF antenna by several S-units....without ever telling us what the other antenna was!

The time limit is 10 minutes for the CQWW contests. This rule was
enacted specifically to address the use of an octopus.

After the initial posting, I discussed this with contesters N2AA and N2EA.
Gene was reminiscing about the days when the octopus was still
legal for field day. Apparently, he and K2SS were able to get into
quit a rhythm using the device and had a ball. Sounded like they
were sorry to see it go.

> ...about submitting technical articles to QST...

I don't think that the lack of technical articles appearing in QST is due to a lack of submissions. The recent publication of the second volume of the "Antenna Compendium" seems to indicate that QST has a SURPLUS of technical article submissions. I would rather have seen these articles appear in QST in place of the 20 treatises on building QRP SWR meters or 2-position antenna switches that permeate the magazine. QST makes a conscious decision to limit the number of technical articles. They represent the entire amateur community and have to present what they feel to be a balanced menu of articles. Of course, the readers of the UseNet forum are, in general, more technically inclined than the average ham and would like to see more technical articles in QST or anywhere.

In view of the demise of Ham Radio, wouldn't it be great if the ARRL raised the status of QEX to that of a sister publication of QST? Both could be nice and glossy (and crammed with ads). QST would be mandatory with ARRL membership and QEX optional, like the relationship between, say, Physics Today and Phys Rev Letters. QST could keep recycling the SWR meter material and QEX could publish very technical works without apology (as they, no doubt, do now).

Pie in the sky?

I dwouldn't have a problem with lower power limits either. I think
you've missed the mark with the beam requirement, though:
1) The number of hams who can afford towers and beams is small.
2) Many hams can put up wire antennas, but can't put up a beam due to
city zoning rules, deed restrictions, etcetera.
3) What about 40 and 80??

Maybe you need to rethink this one.

I'd like to get in touch with anyone who has had direct experience with switched capacitor filters from roughly 15-40 kHz. Write back even if you've done work below this range (audio). Thanks.

Interesting. I've had a packet switch on a mountain top here for about a year and the floppy hasn't experienced any problems. (One difference is that I'm using disk drives with head load--the head isn't in contact with the disk unless it's being used.) On the other hand, it only accesses the disk to boot up, which it hasn't had to do for about six months. Hmmm... maybe I had better check the disk that's in there!

Not the whole third world, Julian, just some parts of it that have no ham radio to speak of. Why? Because by helping to promote ham radio in these parts of the world we may influence the national administrations of these countries to be more favorable to ham radio. And in the ITU, each country has exactly one vote--Zaire's vote counts the same as ours. I don't think tring to increase international support for ham radio is a waste of the members' money. Do you? (BTW, this is not the only effort toward this goal. Although I don't know much about some of the things ARRL is doing in this area, I do know that every year we bring in 7-10 people who are telecomms administrators in third-world countries for a class in amateur radio administration. The class is held at ARRL HQ.)

I think 20m is appropriate technology for the intended purpose and destination.

If this were the only thing going on at HQ I would agree with your complaint. But it isn't. And a lot of people _are_ interested in this stuff, even if you and I aren't. How about a little tolerance for other people's interests? As for the microwave column, in my opinion good feature articles on microwave do far more to promote those bands than that column ever did. I always thought that column preached to the choir; if you weren't already "into" microwave there wasn't much there for you. Nothing wrong with that if it were the most effective way of doing it, but I think the feature articles are better. I dunno all the reasoning why it was dropped, but I can't say I miss it much. (Explain how 10-GHz DX records are any more relevant than DXCC, not counting the fact that you personally are interested in one and not the other.)

> +   * The *RSGB Microwave Handbook Vol. 1* is the latest addition to the

> produce books on Microwaves etc. The book probably has metric
> dimensions too.

Agreed. ARRL's microwave book efforts have been beset by problems, largely having to do with turnover in the editorial staff, but also because it simply wasn't a high priority item. (Note that this was within the Tech Department--I'm not talking about policy here.) It should be out soon, I hear. (I suggested the advertising for it borrow from the old movie ads: "10 years in the making!" They were not amused. :-)

On the other hand, what's wrong with ARRL making RSGB books available to the members? Are we so xenophobic that we shouldn't distribute anything that doesn't have "made in the USA" printed on it?

The problem with working QRP (IMHO) is that there are soooo many ops running their KW monsters all the time that anyone listening soon learns that he/she has to turn their RF gain down to keep from being blasted out of their chair. If everyone on 20 meters ran 5 watts (you probably don't even need that much most of the time) and depended a little more on operating SKILL, the nasty problems would be greatly reduced.

Of course we'll never get everyone to QRP to 5 watts on 20 anytime soon. Nor will we get rid of those folks who think they *own* a frequency and will defend their *claim* with every last milliwatt of power at their disposal.

I think the people on 30, 17, and 12 meters would attest to the fact that they really don't miss the old KW anyway. :-) I think the two things lacking in HF operation today are COURTESY and PATIENCE. Sadly, this is the root of just about all the trouble on 20 these days.

I read on rec.ham-radio some criticism for the policy of ARRL to distribute a book on Microwaves from RSGB and the lack of ability of the ARRL to publish books on such subject.
My point of view is totally different and there I go with my 2 cents!
ARRL books are, to my knowledge, some of the best books on Ham Radio in the world. I mean it, because I have a big collection of Spanish, Italian, French, German, Dutch, English and American books and, even with the problems involved on purchasing some of the components used on circuits, the quality and the care put on explaining things are worth the money.
If you ask other hams around the world they all will tell you they have at hand the ARRL Handbook. And in some Eastern European countries one of the best presents was a current copy of THE handbook... as well as in other parts of the globe.
Well, I think I make my point clear. ARRL books are a heck of ham books, and I wish and expect there will be more. But they cover for now much of my needs as a ham. Maybe if they publish a handbook on Coherent CW or on Hellschreiber machines... :-)
73 for all.

The problem with Ham Radio is that it spells colour as "color". You Americans are so lazy. :)

I've written a few articles that have been published in QST, and I can assure you that they do not have a flood of technical articles being held back because they want to fill QST with general interest articles. The published my article "How to Have Fun in Ham Radio" in the May 1990 issue, when it had been accepted for publication circa January 1989! The editor said that they had so many general purpose articles "on the hook" that the 18 month delay was not unusual.

I would bet that if people who complain about the lack of technical content, or the lack of microwave coverage, or the scarcity of pages dedicated to the Albanian 160M EME Amtor contest, were writing about these things instead of whining, there would be no reason to whine. Ahhh, I suppose then they'd whine that there wasn't enough room for ads.

As far as the ads in QST, objecting to the quantity of ads in a magazine doesn't make a hell of a lot of sense:

A. They keep the price of the magazine down.
2. NOBODY FORCES YOU TO LOOK AT THEM!!!!!!!!!!!!!!!!!!!!!!!!!!!!

I personally never really look to QST, CQ, or HR for deep technical content, anyway, just as I don't look at Popular Science for depth in robotics or solar power. There are zillions of great technical journals providing depth in just about any area you could desire. Most of the good technical articles in the journals are written by motivated people, and are oriented towards a narrow target audience. If you want to read about ducks, buy a book about ducks, not one about birds.

Two credos to live by:

1. If you are not part of the solution, you are the problem.
B. Lead or follow; in either case, get out of the way.

and my personal favorite (after STUFF HAPPENS):

III. Don't worry about the horse being blind, just keep loading
up the wagon.

>>From: price@marlin.NOSC.MIL (James N. Price)
>net discussions about limits on power. But the true DXer will do
>what he/she feels he/she HAS to do to get thru!

And that is precisely the problem! All too often this means crank up the KW (or more, as other posters here have pointed out) and clobber anybody and everybody in the process. It is this selfish attitude that is the root problem (bear in mind that I am *not* suggesting that James N. Price is in anyway an example of either THE problem OR of the selfish attitude - I am merely borrowing a segment of his posting because I think he hit the nail right on the head).

I have read a number of postings in this newsgroup about this subject. Some revolve around antennas, some revolve around power. I suspect that from the *hardware* side of the argument, it is more realistic to call for a reduced power level, arguments about noise levels on some bands notwithstanding, because from listening I know that it is true.

I can feel most comfortable discussing that part of the low bands which I can legally operate (and for which I actually own equipment for) - the Tech. segment of ten meters. It always used to gall the hell out of me as a Novice that high-power dudes would decide that my puny but legal 75 watts was just the right place to tune up. Now I'm sure that there were some occasions when an op. just *didn't* hear me and thus assumed that nobody was there to QRM. Fine, I can live with that. But it used to gall me that many of these clowns would then start transmitting on that frequency. Why does even a General (again, Advanced or Extra included) need to deliberately go into the novice segment of the band, tune up and then transmit with an absurdly high level of power? Isn't there enough spectrum available for Generals and up that the Novices *can't* use? AND, as a "Tech. on Ten", the same sort of question, by analogy, comes to mind. I don't have CFR47 right in front of my face, but I *think* I am limited to 250 watts from 28.3 to 28.5; if that is true, why not limit EVERYBODY using those freqs. to the same UPPER limit, 250 watts max.? Seems to me that this would be eminently fair - 250 can do an awful lot of good with a reasonable antenna. Then if those who CAN work above 28.5 or below 28.3 want to use a bunch o'power, at least outside of that measly .2 MHz they won't interfere with those who are legally stuck with the reduced power level.

Yeah, I know, "this will just complicate everybody's operating"....well, we Amateurs, by reasoning that we have to take a test that requires us to know how to read, are at least semi-literate and intelligent, right? :-)

A note: if the recent rumors about V31BB's passing are true, I would like to state (since I was one who was publically upset with his on-air anti-MFJ rantings) that I am sorry to see this happen, albeit with details unknown. While I (and others, I'm sure) may have disagreed with what he was doing, as a human being I am saddened to hear of his (possible) demise.

Truly, find some deserving novice who is short on funds and give the rig away. Not that an HW-101 is worthless, far from the truth, IT IS WORTH MUCH...MUCH MORE GIVING some on the air experiance to a deserving newcommer!

as for new rigs, drive on over to Burlingame and play with the radios in your price range.

> of the more technical articles that previously went to HR and now no longer
> have a home.

I would not put it that way. I subscribed to 73 for about 5 years up to about 3 years ago (when I switched to HR). Initially it was reasonably technical though not significantly more so than QST -- just different.

Then about a year before I gave up, the technical content drifted downward to the point where the MOST advanced articles were about at the Novice level. Between that and the ever increasing amounts of NSD-ravings I called it quits.

As for CQ, many earlier postings echo my opinion of that rag.

QST is, unfortunately, rapidly sliding downhill too. The first 2 or 3 "wonderful elmer" articles were fun, but enough already! it's sickening to see 10 pages of that stuff every month. I've been maintaining an on-line index of the technical articles from my QST collection; it's very informative to compare the number of entries per month. It has been dropping quite a lot. (Hm... I should graph it and submit an article!)

With HR gone, it seems that there are now NO technical magazines for hams left in the USA. (I'm not counting QEX; it sometimes tries, but it's rather small.)

Incidentally, in response to the statement that we shouldn't complain unless we're submitting technical articles to the rags: that's baloney. The STYLE of a magazine is set by the editorial staff, NOT by the article writers. I can't imagine that the editors of a contest magazine would suddenly start to accepts lots of highly technical articles; ditto for Wayne Green.

Couldn't agree more. Cancelled CQ two years ago as it was and is junk mail. Fortunately, I am within 4 months of renewal of my subscription so will test CQ's ability to change their ways and have so informed Dick Ross, Publisher of CQ.

If CQ doesn't shape up, I suggest you take their offer and cancel for a refund. Lots of cancellations will certainly get their attention. Ham Radio may not have had a big circulation, but ten or twenty thousand cancellations and refunds will certainly put a dent in CQ's economic analysis of the acquisition.

That antenna tuner is still advertising in 73 magazine. I brought that
to the attention of Wayne Greene (I was also a 73 advertiser) and his
answer was essentially that if people are dumb enough to buy it, it's
their problem.

I know many hams that are using the TS440 as a mobile rig and like
it very much. A nice feature to include is the built in automatic
ant tuner. Another rig is the one I use, the Yaesu 757GX. It is a
little smaller than the 440 and is not quite as pricey.

I ordered an MPX-MINI from Digitrex of Rochester, Minnesota.

After three months of waiting and calling, I am still in doubt
about whether I will ever receive the product. They have cashed
my check but lately I have been getting busy signals or no answer
when calling there number: 313-853-3326.

Letters have gone unanswered.

Am I the only person having this problem?

Any help would be dearly appreciated.

Putting up a beam would be very difficult for me I plan on having one in
the future but just can't do it now for several reasons.

>3. It is sometimes necessary to use >200W on 40/80/160 to get over QRN,
>   especially during summer.

This is a very good point but on the othter hand this past FD shortly after
sunrise there were alot of QRO nets that wiped out the band for our
40m dipole station.... Next year we know to QSY off 40m after sunrise.

>4. The use of omnidirectional antennas is appropriate to a roundtable,
>   which is typical of 40/80.

Right on... maybe even on other bands like 10 meter nets but of course
NOT the 20 meter DX nets. As a matter of fact I've stayed of 20m since
I don't have a beam nor amp. 10m, 12m, 15m, 17m and 40m seem to suit
me just fine with 100 watts and an omni.

>5. Ever see an 80 meter beam on a tower ? I've seen K0RF's. It looks
>   tenuous.

Hey anybody have a 160m beam in their back yard?

Maybe whenever we give an S9+ report we should tell them to QRP but
some how I don't expect they would. Maybe they wouldn't even know how to!

saaf@joker.optics.rochester.edu (Lennart Saaf) writes:

> > ...about submitting technical articles to QST...
>
> I don't think that the lack of technical articles appearing in QST is due to a lack of submissions. The recent publication of the second volume of the "Antenna Compendium" seems to indicate that QST has a SURPLUS of technical article submissions. I would rather have seen these articles appear in QST in place of the 20 treatises on building QRP SWR meters or 2-position antenna switches that permeate the magazine. QST makes a conscious decision to limit the number of technical articles. They represent the entire amateur community and have to present what they feel to be a balanced menu of articles. Of course, the readers of the UseNet forum are, in general, more technically inclined than the average ham and would like to see more technical articles in QST or anywhere.

While there are only a specified number of pages of "technical" material each month, I think the gripe I'm hearing has less to do with quantity than with the level of technical sophistication. It is absolutely intentional. Perhaps this extract from the ARRL Author's Guide will help spell it out:

ARTICLE TYPES	QST	QEX
Construction	Projects easily reproduced by majority of hams. Simple projects with broad appeal.	Enough information for readers familiar with common construction techniques to duplicate the project. More complex, state-of-the-art equipment
Theoretical/tutorial	Help beginners learn radio/electronics. Report new advances in technology, the latest designs and constuction techniques.	Discussion of advanced topics. Theoretical analyses of radio/electronics topics.

So if "Another Look at Reflections" (remember? the mid-70's series about transmission lines) were submitted today, it probably wouldn't run at all ("too long"), and certainly not in QST. Things _have_ changed, no doubt about it. (Interestingly, there have been so many requests over the years for reprints of that series--and the concluding articles that the author, Walt Maxwell, never finished--that it is being turned into a book. Walt and the editorial staff have been working on it for a while now. So _somebody_ out there is interested.)

> In view of the demise of Ham Radio, wouldn't it be great if the ARRL raised the status of QEX to that of a sister publication of QST? Both

> could be nice and glossy (and crammed with ads). QST would be

>

There has been some spitballing about expanding QEX, but I don't know how serious it is. Tell your Director what you want. That's the quickest and best way to effect change.

On the subject of tekkies vs politicians:

I've given this subject quite a bit of thought over the past few years. Although I definitely consider myself a tekkie, I often take a strong interest in many of the political issues of the day -- and not just those of amateur radio.

The problem with politicians, and the usual reason I get interested in a particular political issue in the first place, is that they can cause a lot of damage with very little effort. Whether it's the ARRL Board in 1984 shooting down a perfectly reasonable no-code proposal or the US Congress in 1990 trying to abolish the First Amendment, the problem is almost always one of limiting the damage politicians can do.

Although it's very easy for politicians to drill holes in the dike, each of us has only ten fingers to use in plugging them. And while we're standing there with our fingers stuck in the dike, there's little in the way of *constructive* work we can be doing. I would much rather write code, build equipment and do other fun tekkie things than play politics. But when the politicians screw up, the rest of us have an obligation to try to stop them. In other words, getting involved in politics is a dirty job, but somebody's got to do it.

It would be nice if mechanisms could be set up to limit the power of those people who LIKE to play politics, so the rest of us wouldn't have to spend so much unproductive time keeping them in check. That was the original idea behind the US Constitution. I wonder how much longer it can last, given the pounding it has been taking lately...

Phil

Can anyone supply me with specs for the 6DQ6B TV horizontal sweep tube?
The ones I have are made by GE. In particular...

- max plate, screen and grid voltages and currents,

- plate dissipation, capacitance.

Any tips for use in linear service.

Oddly enough, this is the one problem I expected to see that I _didn't_
see in setting up the packet switch here. (The packet switch is probably
a worst-case problem; it has 3 computers: the PC and 2 TNCs.) Considering
that the equipment is in a _wooden_ enclosure, so there's practically

nothing between the equipment and the antenna, electrically speaking, and considering that the antenna is only about 30 feet away, I was amazed. Perhaps it's because a ground-plane antenna has very little response in the down direction? I don't think it's anything to do with the particular antenna, since I have a 2-meter antenna and a 220 antenna of different designs and neither one hears the computer. Maybe I'm just incredibly lucky. (Although other experiences on the mountain make me doubt that!)

I agree with Len (saaf@joker.optics.rochester.edu) almost 100 percent. Especially with his comment about QST being a mag for the entire amateur community. I feel that they address every segment and every interest at the moment. But I also agree that there aren't enough technical articles and maybe that's due to the emphasis placed on other areas. Len dropped a few good suggestions, and, in case anyone at ARRL is listening, here's another suggestion.

How about a separate technical section? It could be one of the "tear-out" types that you often see nowadays in other mags. These are usually a little smaller; they are separately saddlebound; and they are attached by a single (usually perforated) retainer that is bound with the magazine. In this manner they can either be left with the original magazine, or removed and saved separately. All the advertisements from parts and components suppliers could be placed in this "supplement", where the advertisers would be assured that their market would see them, even when they were removed from the mag.

Articles that required some special part or component would have to specify the source of such a part and more-or-less guarantee the availability of the part(s). Nothing will kill the credibility of a construction section quicker than the publishment of projects for which the specified parts can't be found.

I vote for a separate technical section, in which not only are state-of-the-art information published, but also advanced construction projects for radios, computer equipment and antennas. How about a series on the "third-world" radio that Julian McCassey mentioned that is under development at ARRL as a starter???

Eric:
Given the crowded conditions on the HF bands today, variable passband, i.f. shift, RIT, notch filters and narrow filters help tremendously at times to isolate the one signal you are trying to work. At other times, they are not needed at all. You will probably find your HW-101 useable but unsatisfactory during periods of high QRM due to the receiver bandwidth and lack of selectivity features. There are very sharp digitally-tuner

capacitor based audio filters available on the market in the $140 price range that would assist the HW-101 tremendously in CW mode. Such a device would not help SSB, though.

Memories are used to store frequencies and on some radios mode and other operational parameters. They are very useful when you work nets, cross frequency within a band, cross band or just to have one set to WWV to save tuning time. I use them for all the purposes mentioned plus save one to store the freq. of a juicy DX station in who is buried under a pile-up while I look elsewhere in the bands for another. Usine one memory and two vfo's, I can rapidly switch between three if need be.

In your price range are a number of radios such as the Yaesu 747, Icom 725 , and Kenwood TS-140. Most are without power supply (another $140 and up depending upon whether you buy a generic power supply, e.g. Astron, or the manufacturer's supply - which is usually overpriced for what you get) and lack bandpass filters beyond one basic filter. Ten Tec also makes (domestically) a rig, Argosy, I believe, in this price range which is reputed to be very good but I have no experience with it. Some come with antenna tuners, some without. An antenna tuner is a practical necessity for the solid state finals rigs. If you are a traditionalist, Kenwood also still sells the hybrid TS-530 and TS-830 lines, I think - very good and rugged rigs. Personally, I would receommend the Kenwood TS-140S or Icom 725 as they give you all the necessities and just enough amenities - i.e. bang for the buck. Additional bells and whistles (TS-940, TS-950, Icom 767, 781, etc.) rapidly drive the price up to that of a small car (slightly used car?).

Drake no longer manufacturers ham radio equipment but continues to service their products. Drake TR-7's and other models are generally available at Ham Fests and used equipment dealers for reasonable prices ($500 range). All the contemporary rigs are good and personal preference plays a large part in selection. Reputation-wise, Yaesu does not rate well in customer support, Kenwood and Icom seem about equal and generally good if slow. Ten Tec is said to have outstanding customer support My experiences with all three Japanese manufacturers have been satisfactory.

I suggest you go the your local ham radio emporiums (Ham Radio Outlet has a store in your area somewhere plus there are others) and try before you buy. Almost all of the stores have demo units set up so you can operate them. If you are not a subscriber to any ham radio magazines, do so. I recommend ARRL membership and QST. If you are interested in a used rig, you may also find one at vendors who advertise in QST as well as other journals or area ham fests. Equipment information on older gear can be obtained from fellow hams with collections of QST's, CQ's 73's & the late Ham Radio magazines.

CQ magazine publishes a Buyers Guide which may have some value but I would be skeptical of it based upon the lack of quality evident in their product evaluations - whic are more like editorial commercials. They never say anything black about a product, not even slightly gray. QST product evaluations appear the most rigorous and unbiased.

As far as ham radio equipment vendors are concerned, most are o.k. and reputable but operate on slim profit margins, so don't expect any freebies. I bought my TS-430 at HRO in Anaheim and received excellent service. I have since purchased equipment from a range of vendors coast to coast with generally satisfactory results. My current favorite is R&L Electronics in Hamilton, Ohio. My method is to decide what I want and get on the telephone utilizing their 800- numbers or direct-dialing if they don't have one. There will not be a lot of difference in price - expect 8-15% discount from advertised retail or so-called ham-net price. You have to consider the value of saving sales tax (6-8% of the price tag) by buying out of state , shipping charges and wait time. Sometimes, particularly if you are buying more than a basic rig, you can shave another 2-5% or more off the price, save the sales tax, and get the dealer to pay for the shipping if you buy all items from one vendor.

Value of your HW-101 depends upon condition but generally would be in the $200 range at a ham fest - lower on trade in, I suspect.

Good luck and best regards, Wayne, KB6CSP

>Re using PC's as repeater controllers:
>
>Nobody has mentioned any potential problems with RFI. My XT causes significant interference to my 2M rig. Seems like there would be a potential problem placing an unshielded PC on a mountaintop in a vault filled with dozens of repeaters at different frequencies.

Actually, Al, there are. That's why site owners throw hams off the hill first. Well, maybe not always first, but in the back of their minds, it's not a bad idea...

PC on hilltops need to be in fairly well-shielded cases, complete with feedthroughs and such, and preferably no outward indication that it's a pc.

'Course, on our local hilltop, the biggest problem is the guy who runs
three GMRS radios, with no isolators on the transmitters; the transmitters
also put out broadband hash that flames our own receiver on 440.

But, heck, for the few more years that it'll be in existence, ham radio's a
great hobby...

Someone mentioned that there was a voice card available for less than $100. I'm interested in such a card. Does anyone know the name of the company and a phone number?

Unfortunately, 4 months is not much lead time. If there were significant changes to appear in that time frame, I might expect them to be really pushing it in light of the H.R. acquisition.

In other words, they *-may-* change, but it *-will-* take time.

YES, YES, the directors DO listen and they ARE ELECTED by us members. There are seven director posts up for election this year, that's more than HALF of the directorships. Let's tell them how we feel about this attempt to redirect our technical appetites. The director and vice-directorships up this year are: Central, Hudson, New England, Northwestern, Roanoke, Rocky Mountain, Southwestern and West Gulf Divisions. Those of you in clubs, get petitions signed or resolutions passed which state your feelings regarding QST technical content and QEX status, make these interests KNOWN to any and all candidates and then, (for members only) get statments from the candidates and VOTE when you get your ballot. It COULD work.

Well you did ask. Many of the folks who moved to VHF did so partly to get away from the endless contesting and DXing that have ruined the HF bands.

>and elsewhere? I would love to get in on such an activity. Just tuning
>around, I hear so much garbage and feel helpless to do anything about it, as
>many others have stated here.

I guess I qualify as a member of the auxiliary (OOC for SCV ;-)
so I'll try to answer some of your questions. The Amateur Auxiliary
is able to send notices to stations who the OO believes is in some
manner not complying with Part 97. This can be anything from
not IDing every ten minutes to jamming. This is an attempt at

self-policing. The OO doesn't have any special powers, he's just another ham, no more than that.

>How does the Auxiliary work? I guess I can whip out the Handbook. Hmmm...
>precious little. It refers to an article in QST of Aug '84.

Well, we listen alot. If we hear something that sounds like a violation we'll write a card to the station we heard. The card indicates what the OO heard, along with a reference to the relevant section of Part 97.

If a problem persists the OO can bring the situation to the attention of the OO Co-ordinator for his section. The OOC can either ask for help from what is known as the Regional Monitoring Station or try to deal with it himself. In my section I worry mostly about VHF problems, and will try to deal with these myself. If its an HF problem I'll pass it up the chain to the RMS.

The RMS stations are appointed by directors and are the ham equivalent of the FCC monitoring stations. There aren't to many of these stations. In CA we have a total of 3(that I'm aware of).

When a problem can't be solved by peer pressure then the only choice left to the OOC/RMS is to turn the problem over to the FCC. Before this can happen the OOC/RMS must inform the ARRL division director about the case. How this turn over occurs is different in each section. My section (Santa Clara Valley) has a Memorandum of Understanding with the the San Francisco FCC office about how this is to happen. This agreement has been in place for just a year and we've had pretty good results so far.

The FCC in our section requires that we supply them with information about what the we believe the violation is, when it is occuring, and which city we believe the station to be located. The biggest part of this list is the nature of when the offense is occuring. It must be repetitive and predictable for the FCC to come out. They don't have a great deal of man-power so FCC uses the amateur auxiliary to do some of the foot work before they show up on the seen. FCC gets alot of calls of the sort "Well, this guy is on the repeater and he's cussing all the time." So the FCC asks when he's on and gets the reply "Oh, he's on all the time...I heard him on last night, then he was on maybe a week ago in the morning." That's why the repetitive/perdictable part ;-)

>But hey, if we all write to our section managers (the guys that control the
>Auxiliary for their area) and find out about this, maybe we CAN do something!

Feel free! I can assure you that the next SM of the SCV has a pretty good understanding of the situation here ;-) and for that matter the current one does too (Glen, WB6W, is my partner when I go out on most of my DFing expeditions.) Your SM can at least direct you to the OOC in your section.

The real problem we have isn't VHF because that can be dealt with
fairly effectively at the local level. HF with its' capability
of spanning the country/globe is harder nut to crack. How do
you DF someone thats half a continent away, then do something
about it? I'm not sure there is a good answer for this one.
I sure don't have it anyway....

>I'm not one to advocate "tattling" on a fellow ham, but if he is deliberately
>abusing the privilege, than screw it! Let the FCC know and hope that $1000
>fine does the trick!

This is a fine point that maybe needs to be discussed. The Auxiliary tries
to use peer pressure to get people to moderate their behavior. Thats
the only tool we have. We aren't band cops, just merely other hams that
have to live-on/use the same frequencies. When peer pressure fails then
the FCC is the only resort we have. FCC also gives a person one chance
before fines start getting levied. If the person heeds that warning
that will be the end of it. This is what happened in the two casses
that I've turned over to FCC in the last year. I'm glad it turned
out that way. The two offending parties started behaving themselves
and that was the end of it.

>What do you all say? I have not heard of ANYONE being in the Aux., nor have I
>heard any mention of it in all my many years of hamming. (1.5, to be
>precise!) :-)

Well now you've heard from someone ;-) I'll be glad to try and answer
any questions you've got.

It sure would cut down on the round-table QSO's & networks.

Oh, and the mobile operators might think it was a bit of an imposition.

I would think that Kilowatt ops are more likely to have a beam & tower
already. Either they have more money to spend, or are willing to spend
more of what they have on the hobby.

We have a lot more room with most people running SSB rather than AM,
but we didn't have to legislate to accomplish it. People switched for
their own reasons (like more bang for the watt).

OK, you've made a positive contribution right there, only two weeks out of
the mailbox. (Congrats, BTW!)

Anything a ham does for the public, whether its a courtesy phone patch/remote call, or getting help to someone stranded in a flood or earthquake, is on the plus side.

We need all of that we can get. Good show.

Now. Were those folks (since they were up on a mountain...) part of a club or organization (climbing club, environmentalist organization, whatever?)

Is there a way you can arrange for a presentation at one of their meetings about ham radio? If not yourself, maybe someone from your radio club is not uncomfortable in front of a strange group...

SYSMSGSBE-W-WARNING: SOAPBOX MODE ENGAGED...

That's a little more agressive, and I think that is what Patty and some of us were looking for. I unfortunately, between work and running code practice for the club and helping out with the VE team have plenty to do. If I had about three more nights per week, I'd like to seek out new life and new civi-... oops... new organizations that need programs and present to Lion's Club and Elks and Shriner's and Ladies' Auxiliary of the Volunteer Fire Department... and present ham radio as it is (or as we hope it to be!)

Two things are possible if you do that right...

(1) Jane and John Q. Public know FOR REAL what ham radio is, not what rumor and misinformation make of it, and
(2) SOMEBODY might get interested.

(2) is nice, but they're not going to beat your door down. (1) builds a firm foundation on which (2) can build from.

Maybe, maybe not. But it sure can't hurt...if it's done well.

SYSMSGSBE-I-NOTICE: SOAPBOX MODE TERMINATED.

Have fun with your new license. Go try all the neat things you can do, and if you can do a favor for a friend or a stranger, let 'em know it was a HAM who did it!

Maybe one slightly different tack is to approach the TEACHERS, make resources and training availble to them, and offer to assist with transferring it to the students.

I get the impression a lot of teachers feel tied up with budget constraints and administrative policy.

If you can get one teacher interested in ham radio, that might lead to getting a dozen students involved...

Just a thought!!

73,
Bob

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
```

This file is: INTRO MODS

MODS database
---- --------

This database was setup to archive files containing information on how to modify radio equipement to either improve its performance, or add new functions or capabilities to the radio.

*** AS of Nov 1, 1989 FTP access from the internet is available
HAMSTER.business.uwo.ca   [129.100.22.100]

To access a file from the archive via mail, send a message to the server running under userid -> BITLIB@UWO.CA
Also you may try the userid -> BITLIB@UWO.CDN

The subject of the message MUST be ->   MODS
If your mailer does not ask for the subject; make the first line of your message look like this:

SUBJECT: MODS

The server ignores all messages that do not have MODS in the subject field. All bad requests get re-routed to my userid ,and I eventually read them, fix them, and re-submit them.

The text of your message descibes what files you want. For example:
sendme intro mods
sendme radio mods
sendme TH215 mods

You can have as many requests in the same message as required.
INTRO MODS is the file you are reading now.
RADIO MODS is a list of files available.
TH-215 MODS is a file that can be requested.

Below is an example of a file request message:

```
......................................................................
.
.   Date:    Friday, April 5, 1989
.   From:    MBRAMWEL@BUSINESS.UWO.CA (Mark Bramwell)
.   Subject: MODS
.   To:      bitlib@uwo.ca
.
.   from: mbramwel@uwo.ca
.   sendme radio mods
.   sendme pro2004 mods
.   sendme tm721 mods
.
.................................................................
```

In the above example I have a 'from:' line in my message. That will tell the server to send to an id other than the id listed in the header. The userid should be reachable from bitnet. That means UUCP users should include a gateway in their id.

To submit a file for the database, send me the message and I will add your entry to the database.

**Note: If you don't seem to be getting a reply to your requests, it is probally due to the fact that your header doesn't show a reachable address. You must be reachable from UWO. You can place your return address in the first line of your message. Example:
  FROM: someuser@somenode

UUCP users have had some success by stating their address as:
  userx!usery!userz@julian.uucp
Julian can usually find most gateways.

Any questions or concerns can be directed to:

Mark Bramwell VE3PZR
University of Western Ontario
School of Business Administration
London, Ontario

Re: Goodbye Ham Radio Magazine

* I said goodbye to HR some time ago. I feel that they lost the formula that made them successful. The magazine appealed to the more technical portion of the amateur radio population. About three or four years ago, I think they forgot this fact and started watering down their technical content. I had written a couple of articles for them and conversations with their editors began to center more on sure fire idiot proof construction and less on technical content (IMHO).
  At that point I pulled the plug on my subscription, so I have no recent experience with HR.

* Wireless World is a really interesting magazine. It has a great mix of electrical engineering, amateur radio, general electronics hobbyist stuff, basic theory and pseudo-science. The downside is 1) ads are for UK products 2) prices are in pounds 3) words like color are spelled 'colour' 4) expensive in the US.

I agree. Magazines don't dream up this stuff - we do. When was the last time you did something original ? If you have a better, cheaper, faster way to do something and don't publish, it's as if you never thought of it at all.

What about me ? I'm working on a cheaper soft-start for high-power (tube) RF amps. Does one already exist ? I don't know - I haven't seen one yet.

By the way, I find this newsgroup to be a powerful counter point to the regular mags. We can say what we want against CQ and QST in an unedittted manner. We can also exchange ideas in a way not possible via a magazine. I even find technically useful information, despite the lack of graphics.

>Is there a television set operating nearby? I get all kinds of RFI from my TV,
>and a bit from the neighbors'. The horizontal oscillator operates at
>15.734 KHz.

Yeah, I get this one, too. Lessee - 30 Mhz is on about the 2000th
harmonic. That's a sharp sawtooth indeed ! Can I put a ferrite bead
on a wire somewhere in the telly to get rid of this ?

My wife finds it ironic she QRMs me as much as I QRM her. :-)

Just a word of caution - disk drives are less rugged than most electronics.
If the controller spends most of it's time in an air-conditioned shack, it
should be fine. :-)

RTTY DX Notes, 1of3, 6/22/90

RTTY DX Notes for Weekending 22nd June 1990.
Part 1 of 3.
BID: $RTDX0622

The ANARTS contest has come and gone, and if you thought that the propagation was poor for that weekend, you should have a look at it now. Even the intruders are missing. But we have received some logs, and from some of the scores there was little to complain about. Keep the logs coming, chaps.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, OD5NG, PJ2MI, TG9VT, VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster. Thank you all for your assistance. Every little bit helps.

```

QSL Information:

ED9CI says to QSL via EA9KQ.

T5RM will QSL via HB9RTR, 134 Saules, 1233 Bernex, Switzerland.

HK0BKX (San Andres) via WB9NUL.

FY5DG is at Box 450, Kouru, French Guyana.

SU1HN will QSL via Box 1578, Alf Maskan, Cairo.

EA6MQ will QSL via his Callbook address.

Notes of Interest:

ED9CI was the station that was reported last week as having the callsign of AN9CI. The call was changed at the last moment, but it was still Aure on Chafarinas Island.

YL1WW is in Riga, USSR. No further information at this time.

TV9GIR will be a special call from Margaux Island (north of Bordeaux) on June 23/24. They will operate all bands and modes (including CW on 10 MHz). QSL via FD1MRE or via the bureau.

We appear to be a little short of information this week, but propagation has been very poor, and someone has taken Africa off the map.

GL DE DX1 (VK2EG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

>and or mobile transceiver with us. (ICOM-IC24AT and 3210, USA models)
>We would like to use them to meet local hams, as well as for travel advice.
>Are there repeaters on 2M and 440 MHz around those countries as there are here,
>and will our current equipment be fine for accessing them, or do they have
>different requirements for access, such as special tones, or different offsets?

The repeaters in Holland are all located in the 145.6 - 145.775 region, and most of them do not require a tone burst to start them up. The offset is as in the US, -600 Kc for the input frequency. On 70cm most of the repeaters are in the 430.000 - 430.500 region, requiring a +1.6Mc shift for the input frequency. Remember the bandplan is a lot smaller in Holland for 2m and 70cm as it is in the US, but you can easaly find that your reciprocal license (I guess).

>Are the operating procedures on VHF/UHF repeaters similar to in the USA?

When I was over in the US, I noticed no big differences, so I guess they are the same.

>Can we obtain directories of repeaters, before we leave home.

It'll be probably (again) in your receprocal license agreement, but if not, I'm quite willing to help you out.

>What is the required procedure for reciprocal operating privileges?

As I did for Canada and the US, request one. The address, I think, you can use for Holland is:

HDTP/ Directie Operationele Zaken
Postbus 450
9700 AL Groningen
The Netherlands.

Include to speed up the procedure, copies of your US licenses. As noted before, you might have to pay for your license(s)!

>Please reply via email, if possible.

Why personaly, I think it could be of interest for a wider audiance too.

Hope to hear you.

IMHO, using a PC as a repeater controller is a good idea, and shouldn't be difficult to implement. PC's are nice because most of the hard work that would normally have to be done in hardware in a non-CPU based repeater can be done in software. Access codes can be easily changed, PROMS don't have to be burned for different CW ID's, the ID's themselves can be generated by the computer, etc. The way I see it, the above caveat can easily be remedied by not using floppy drives/a hard drive in normal operation. The system should be set up so that upon booting, both the control software and all data necessary to run the repeater, including the custom control codes, ID's, messages, etc. should all be loaded into memory to prevent unnecessary use of the disk drive and also to increase speed. But that's probably pretty obvious. I can't think of any real reason why the computer would have to write anything to disk as the repeater is used. What's there to be logged that easily be converted to a digital format that's of any use?

BTW, most of the interfacing can probably be done without having to directly communicate with the computer byte-wise. Control lines on the RS232 port make handy binary lines. Having the computer set lines high is a quick and efficient way of flipping relays, keying CW, etc. They can be used as input as well - have a receiver set the line high when a signal opens squelch. It's a lot easier than having to read and write 8 bits on the data lines and allows for more than one device to be connected to the computer unlike 2-device serial communications. And if one port isn't enough, another serial port can be added for about $25. A stripped-down single-floppy XT clone with 2 serial ports should cost less than $500 new, probably under $300 used. If money is really tight, use as C64 (ick) or trash-80.

About the only "real" communications that would be necessary would be getting DTMF tones from the receiver to the computer. That shouldn't be all that difficult either. Less than 5 chips in actuality. Take a DTMF decoder and a UART and you're 99% done. Things like detecting S/N for voting or detecting PL might be a bit more difficult, but they would be necessary in a non-computer-based repeater anyway. Control of the repeater would be simple - just tack on a modem.

If you do decide to go through with the project, keep us posted. I'd be interested in hearing how you went about the whole project. I'm sure it's been done many other times before, but it would still be interesting.

One has to be careful not to step on the toes of the local science teachers, principles, etc. but I've found them to be open to ideas, HELP, etc. We raised money for

Maybe one slightly different tack is to approach the TEACHERS, make resources and training availble to them, and offer to assist with transferring it to the students.

I get the impression a lot of teachers feel tied up with budget constraints and administrative policy.

If you can get one teacher interested in ham radio, that might lead to getting a dozen students involved...

Just a thought!!

73,
Bob

ZCZC AP30

PROPAGATION FORECAST BULLETIN 26 ARLPP026
FROM ED TILTON, W1HDQ
SPRING HILL FL JUNE 25, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS OFF TO A GOOD START EARLY IN JUNE, BUT IT PEAKED AT 217 ON THE 12TH. THIS WAS 51 POINTS BELOW THE YEARS HIGH OF 268 SET ONE MONTH EARLIER. THE SOLAR FLUX THEN SLID BACK TO 133 BY THE 23RD. IT ROSE A BIT ON THE 24TH AND IT MAY BE ON ITS WAY TO HIGHER LEVELS THIS WEEK.

SOME NEW ACTIVITY WAS SEEN IN THE EASTERN PORTION OF THE SUN OVER THE WEEKEND, AND MORE MAY BE SHOWING UP IN THE NEXT FEW DAYS. ITS PROGRESS CAN BE FOLLOWED BY LISTENING TO INFORMATION GIVEN BY WWV AT 18 MINUTES AFTER EACH HOUR.

DESPITE THE LOW SOLAR FLUX, PROPAGATION WAS FAIRLY GOOD LAST WEEK, EXCEPT THAT BANDS ABOVE 21 MHZ MAY HAVE BEEN MARGINAL FOR DX USE AT TIMES WHEN SPORADIC E SKIP WAS IN. IT MAY HAVE BEEN MUCH OF THE TIME AND IT WILL BE WITH US OFTEN WELL INTO JULY, AT LEAST.

E SKIP IS USEFUL FOR MEDIUM DISTANCE WORK ON 28 AND 50 MHZ, AND IT MAY SHOW UP ON 144 MHZ AT TIMES, ESPECIALLY IN JUNE AND EARLY JULY. IT IS LIKELY TO BE VERY ERRATIC AND SHORT LIVED ON 144 MHZ.

AMERICAN SUNSPOT NUMBERS FOR JUNE 14 THROUGH 20 WERE BETWEEN 67 AND 125 WITH A MEAN OF 95.4. AR

Subject: ATV BALLOON LAUNCH (Northeastern USA)
To: info-hams@ucsd.edu

WB8ELK's BALLOON Launch carrying LIVE ATV is going on as scheduled. The launch net will be on 40 meters LSB 7155 KHz. "CAP COMM" will be WA3USG. Net will commence at 8:30 AM EDT with launch expected at 9:00 AM EDT. Video will be on 439.25 (CABLE CH 60). Beacon frequency 144.34.

Bill (WB8ELK) is inviting everyone out to the launch sight to view the launch. Bill is also in need of some people with FOX HUNTING skills to help with the recovery. If you can help please contact him direct at 73 Mag Phone: 603-525-4201.

If you view the video or hear the beacon please get in touch with Bill. He will certainly want to get reception reports.

73
Gene WA1UXA

Note: Bill's Packet address is WB8ELK @ WA1WOK.NH.USA.NA

>and or mobile transceiver with us. (ICOM-IC24AT and 3210, USA models)
>We would like to use them to meet local hams, as well as for travel advice.
>Are there repeaters on 2M and 440 MHz around those countries as there are here,
>and will our current equipment be fine for accessing them, or do they have
>different requirements for access, such as special tones, or different offsets?

The repeaters in Holland are all located in the 145.6 - 145.775 region, and most of them do not require a tone burst to start them up. The offset is as in the US, -600 Kc for the input frequency. On 70cm most of the repeaters are in the 430.000 - 430.500 region, requiring a +1.6Mc shift for the input frequency. Remember the bandplan is a lot smaller in Holland for 2m and 70cm as it is in the US, but you can easaly find that your reciprocal license (I guess).

>Are the operating procedures on VHF/UHF repeaters similar to in the USA?

When I was over in the US, I noticed no big differences, so I guess they are the same.

>Can we obtain directories of repeaters, before we leave home.

It'll be probably (again) in your receprocal license agreement, but if not, I'm quite willing to help you out.

>What is the required procedure for reciprocal operating privileges?

As I did for Canada and the US, request one. The address, I think, you can use for Holland is:

HDTP/ Directie Operationele Zaken
Postbus 450
9700 AL Groningen
The Netherlands.

Include to speed up the procedure, copies of your US licenses. As noted before, you might have to pay for your license(s)!

>Please reply via email, if possible.

Why personaly, I think it could be of interest for a wider audiance too.

Hope to hear you.

Subject: Dubious quality of CQ review of AEA IsoLoop
To: info-hams@ucsd.edu

In article <42200@apple.Apple.COM> kchen@Apple.COM (Kok Chen) writes:
>Theoretical arguments against small antennas are very compelling. (The

Well, I dunno. One of my antenna references (_Antenna Theory and Design_, W. Stutzman, G. Thiele) does an analysis of a circular loop 0.2 wavelengths in circumference at 1 MHz. The calculated impedance is 0.316+j285.8. With copper wire with a conductivity of 5.7E-07 mhos/m, the total input resistance is calculated at 0.324 ohms. This yields an efficiency of 97.5%. Not bad. The horizontal radiation pattern (free space) is only slightly inferior to a dipole in its most favored direction. Again, not bad.

Of course, losses in any network used for matching to the transmission line aren't considered in this. But it still indicates that small loops *might* work pretty well. Whether the AEA job does or not is still an open question. Hopefully, someone out there will actually TEST one and let the rest of us know.

>

Ah hah! Another fan of good bad movies! I think it was called "Dangerous
Rescue." It was produced by Zarkoff. We (Jim Blakey and I) use our own
rating scheme:

- good/good : Star Wars, Die Hard, etc. A movie that tries to be a good movie and succeeds.
- bad/good : Out Of Africa (IMHO), Star Trek V. A movie that tries to be a good movie and fails.
- good/bad : Toxic Avenger, Killer Klowns. A movie intended to be bad that succeeds.
- bad/bad : Toxic Avenger II, etc. A movie intended to be bad that fails. These are the most painful to watch.

See ya at the bad movies! (too bad I can't use my ATV setup to broadcast
them locally.)

Subject: Homebrew repeater controllers
To: info-hams@ucsd.edu

In article <7880166@hpfcdc.HP.COM> perry@hpfcdc.HP.COM (Perry Scott) writes:
>Just a word of caution - disk drives are less rugged than most electronics.
>If the controller spends most of it's time in an air-conditioned shack, it
>should be fine. :-)
>
>Perry Scott

IMHO, using a PC as a repeater controller is a good idea, and shouldn't be
difficult to implement. PC's are nice because most of the hard work that
would normally have to be done in hardware in a non-CPU based repeater
can be done in software. Access codes can be easily changed, PROMS
don't have to be burned for different CW ID's, the ID's themselves can
be generated by the computer, etc. The way I see it, the above caveat
can easily be remedied by not using floppy drives/a hard drive in normal
operation. The system should be set up so that upon booting, both the
control software and all data necessary to run the repeater, including
the custom control codes, ID's, messages, etc. should all be loaded into
memory to prevent unnecessary use of the disk drive and also to increase
speed. But that's probably pretty obvious. I can't think of any real
reason why the computer would have to write anything to disk as the
repeater is used. What's there to be logged that easily be converted

to a digital format that's of any use?

BTW, most of the interfacing can probably be done without having to directly communicate with the computer byte-wise. Control lines on the RS232 port make handy binary lines. Having the computer set lines high is a quick and efficient way of flipping relays, keying CW, etc. They can be used as input as well - have a receiver set the line high when a signal opens squelch. It's a lot easier than having to read and write 8 bits on the data lines and allows for more than one device to be connected to the computer unlike 2-device serial communications. And if one port isn't enough, another serial port can be added for about $25. A stripped-down single-floppy XT clone with 2 serial ports should cost less than $500 new, probably under $300 used. If money is really tight, use as C64 (ick) or trash-80.

About the only "real" communications that would be necessary would be getting DTMF tones from the receiver to the computer. That shouldn't be all that difficult either. Less than 5 chips in actuality. Take a DTMF decoder and a UART and you're 99% done. Things like detecting S/N for voting or detecting PL might be a bit more difficult, but they would be necessary in a non-computer-based repeater anyway. Control of the repeater would be simple - just tack on a modem.

If you do decide to go through with the project, keep us posted. I'd be interested in hearing how you went about the whole project. I'm sure it's been done many other times before, but it would still be interesting.

It sure would cut down on the round-table QSO's & networks.

Oh, and the mobile operators might think it was a bit of an imposition.

I would think that Kilowatt ops are more likely to have a beam & tower already. Either they have more money to spend, or are willing to spend more of what they have on the hobby.

We have a lot more room with most people running SSB rather than AM, but we didn't have to legislate to accomplish it. People switched for their own reasons (like more bang for the watt).

Not really. My club just got its renewal notice for QEX and I have decided not to renew it. (We are an ARRL-affiliated club, by the way, which has some *teriffic* benefits).

My problem with QEX is redundancy. I have seen an article that says, "Let's have fun and build a 20-meter cw portable tranceiver that works on a 9-volt battery!" SOOOOO many times - this is the sort of thing that belongs in the handbook, and not to pop up in QEX two or three times a year.

> mountains. If that doesn't stimulate interest, I dunno what will.
>

OK, you've made a positive contribution right there, only two weeks out of the mailbox. (Congrats, BTW!)

Anything a ham does for the public, whether its a courtesy phone patch/remote call, or getting help to someone stranded in a flood or earthquake, is on the plus side.

We need all of that we can get. Good show.

Now. Were those folks (since they were up on a mountain...) part of a club or organization (climbing club, environmentalist organization, whatever?)

Is there a way you can arrange for a presentation at one of their meetings about ham radio? If not yourself, maybe someone from your radio club is not uncomfortable in front of a strange group...

SYSMSGSBE-W-WARNING: SOAPBOX MODE ENGAGED...

That's a little more agressive, and I think that is what Patty and some of us were looking for. I unfortunately, between work and running code practice for the club and helping out with the VE team have plenty to do. If I had about three more nights per week, I'd like to seek out new life and new civi-... oops... new organizations that need programs and present to Lion's Club and Elks and Shriner's and Ladies' Auxiliary of the Volunteer Fire Department... and present ham radio as it is (or as we hope it to be!)

Two things are possible if you do that right...

   (1) Jane and John Q. Public know FOR REAL what ham radio is, not what rumor and misinformation make of it, and
   (2) SOMEBODY might get interested.

(2) is nice, but they're not going to beat your door down. (1) builds a firm foundation on which (2) can build from.

Maybe, maybe not. But it sure can't hurt...if it's done well.

SYSMSGSBE-I-NOTICE: SOAPBOX MODE TERMINATED.

Have fun with your new license. Go try all the neat things you can do, and if you can do a favor for a friend or a stranger, let 'em know it was a HAM who did it!

RTTY DX Notes for Weekending 22nd June 1990.
Part 1 of 3.
BID: $RTDX0622

The ANARTS contest has come and gone, and if you thought that the propagation was poor for that weekend, you should have a look at it now. Even the intruders are missing. But we have received some logs, and from some of the scores there was little to complain about. Keep the logs coming, chaps.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, OD5NG, PJ2MI, TG9VT, VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster. Thank you all for your assistance. Every little bit helps.

J73EH	14082	at	0440Z
EA6MQ	14088	at	0516Z

QSL Information:

ED9CI says to QSL via EA9KQ.

T5RM will QSL via HB9RTR, 134 Saules, 1233 Bernex, Switzerland.

HK0BKX (San Andres) via WB9NUL.

FY5DG is at Box 450, Kouru, French Guyana.

SU1HN will QSL via Box 1578, Alf Maskan, Cairo.

EA6MQ will QSL via his Callbook address.

Notes of Interest:

ED9CI was the station that was reported last week as having the callsign of AN9CI. The call was changed at the last moment, but it was still Aure on Chafarinas Island.

YL1WW is in Riga, USSR. No further information at this time.

TV9GIR will be a special call from Margaux Island (north of Bordeaux) on June 23/24. They will operate all bands and modes (including CW on 10 MHz). QSL via FD1MRE or via the bureau.

We appear to be a little short of information this week, but propagation has been very poor, and someone has taken Africa off the map.

GL DE DX1 (VK2EG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

>15.734 KHz.

Yeah, I get this one, too. Lessee - 30 Mhz is on about the 2000th harmonic. That's a sharp sawtooth indeed ! Can I put a ferrite bead on a wire somewhere in the telly to get rid of this ?

My wife finds it ironic she QRMs me as much as I QRM her. :-)

I agree. Magazines don't dream up this stuff - we do. When was the last time you did something original ? If you have a better, cheaper, faster way to do something and don't publish, it's as if you never thought of it at all.

What about me ? I'm working on a cheaper soft-start for high-power (tube) RF amps. Does one already exist ? I don't know - I haven't seen one yet.

By the way, I find this newsgroup to be a powerful counter point to the regular mags. We can say what we want against CQ and QST in an unedditted manner. We can also exchange ideas in a way not possible via a magazine. I even find technically useful information, despite the lack of graphics.

Re: Goodbye Ham Radio Magazine

* I said goodbye to HR some time ago. I feel that they lost the formula that made them successful. The magazine appealed to

the more technical portion of the amateur radio population.
About three or four years ago, I think they forgot this fact
and started watering down their technical content. I had written
a couple of articles for them and conversations with their
editors began to center more on sure fire idiot proof construction
and less on technical content (IMHO).
At that point I pulled the plug on my subscription,
so I have no recent experience with HR.

* Wireless World is a really interesting magazine. It has a great mix of electrical engineering, amateur radio, general electronics hobbyist stuff, basic theory and pseudo-science. The downside is 1) ads are for UK products 2) prices are in pounds 3) words like color are spelled 'colour' 4) expensive in the US.

A new term to add to the HDTV glossary, waveform modulation is given a brief mention in the July 1990 issue of _Video_Magazine_, page 50.

According to the article, Production Services, Inc. of Tuscon, Arizona claims they can "squeeze a full-blown HDTV signal and a conventional NTSC signal within the same 6 MHz frequency channel" by using "a new modulation technology to add information to the spectrum without interference."

Richard Gerdes, PSI co-founder, explains that their technique "alters the shape of the carrier and transmits the result of that altered wave shape."

At the NTSC level:

> PSI gas already developed a commercial product using waveform modulation for NTSC broadcasts: an encoder and decoder that allows an NTSC station to broadcast two channels simultaneously from one transmitter. "You could tune to channel 4A or 4B using the decoder," Gerdes says. The FCC has already granted an experimental license for channel 11 in Tuscon, a Fox Network affiliate, to begin testing the system.

Article aside, has anyone in Tuscon seen this? Any elaborations on waveform modulation; PSI's technology?   And does WM have implications for other EM-based communications?

Maybe one slightly different tack is to approach the TEACHERS, make resources and training availble to them, and offer to assist with transferring it to the students.

I get the impression a lot of teachers feel tied up with budget constraints and administrative policy.

If you can get one teacher interested in ham radio, that might lead to getting a dozen students involved...

Just a thought!!

73,
Bob

ZCZC AP30
PROPAGATION FORECAST BULLETIN 26 ARLPP026
FROM ED TILTON, W1HDQ
SPRING HILL FL JUNE 25, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS OFF TO A GOOD START EARLY IN JUNE, BUT IT PEAKED AT 217 ON THE 12TH. THIS WAS 51 POINTS BELOW THE YEARS HIGH OF 268 SET ONE MONTH EARLIER. THE SOLAR FLUX THEN SLID BACK TO 133 BY THE 23RD. IT ROSE A BIT ON THE 24TH AND IT MAY BE ON ITS WAY TO HIGHER

LEVELS THIS WEEK.

SOME NEW ACTIVITY WAS SEEN IN THE EASTERN PORTION OF THE SUN OVER THE WEEKEND, AND MORE MAY BE SHOWING UP IN THE NEXT FEW DAYS. ITS PROGRESS CAN BE FOLLOWED BY LISTENING TO INFORMATION GIVEN BY WWV AT 18 MINUTES AFTER EACH HOUR.

DESPITE THE LOW SOLAR FLUX, PROPAGATION WAS FAIRLY GOOD LAST WEEK, EXCEPT THAT BANDS ABOVE 21 MHZ MAY HAVE BEEN MARGINAL FOR DX USE AT TIMES WHEN SPORADIC E SKIP WAS IN. IT MAY HAVE BEEN MUCH OF THE TIME AND IT WILL BE WITH US OFTEN WELL INTO JULY, AT LEAST.

E SKIP IS USEFUL FOR MEDIUM DISTANCE WORK ON 28 AND 50 MHZ, AND IT MAY SHOW UP ON 144 MHZ AT TIMES, ESPECIALLY IN JUNE AND EARLY JULY. IT IS LIKELY TO BE VERY ERRATIC AND SHORT LIVED ON 144 MHZ.

AMERICAN SUNSPOT NUMBERS FOR JUNE 14 THROUGH 20 WERE BETWEEN 67 AND 125 WITH A MEAN OF 95.4. AR

WB8ELK's BALLOON Launch carrying LIVE ATV is going on as scheduled. The launch net will be on 40 meters LSB 7155 KHz. "CAP COMM" will be WA3USG. Net will commence at 8:30 AM EDT with launch expected at 9:00 AM EDT. Video will be on 439.25 (CABLE CH 60). Beacon frequency 144.34.

Bill (WB8ELK) is inviting everyone out to the launch sight to view the launch. Bill is also in need of some people with FOX HUNTING skills to help with the recovery. If you can help please contact him direct at 73 Mag Phone: 603-525-4201.

If you view the video or hear the beacon please get in touch with Bill. He will certainly want to get reception reports.

>We would like to use them to meet local hams, as well as for travel advice.
>Are there repeaters on 2M and 440 MHz around those countries as there are here,
>and will our current equipment be fine for accessing them, or do they have
>different requirements for access, such as special tones, or different offsets?

The repeaters in Holland are all located in the 145.6 - 145.775 region, and most of them do not require a tone burst to start them up. The offset is as in the US, -600 Kc for the input frequency. On 70cm most of the repeaters are in the 430.000 - 430.500 region, requiring a +1.6Mc shift for the input frequency. Remember the bandplan is a lot smaller in Holland for 2m and 70cm as it is in the US, but you can easaly find that your reciprocal license (I guess).

>Are the operating procedures on VHF/UHF repeaters similar to in the USA?

When I was over in the US, I noticed no big differences, so I guess they are the same.

>Can we obtain directories of repeaters, before we leave home.

It'll be probably (again) in your receprocal license agreement, but if not, I'm quite willing to help you out.

>What is the required procedure for reciprocal operating privileges?

As I did for Canada and the US, request one. The address, I think, you can use for Holland is:

HDTP/ Directie Operationele Zaken
Postbus 450
9700 AL Groningen
The Netherlands.

Include to speed up the procedure, copies of your US licenses. As noted before, you might have to pay for your license(s)!

>Please reply via email, if possible.

Why personaly, I think it could be of interest for a wider audiance too.

Hope to hear you.

To: info-hams@ucsd.edu

In article <42200@apple.Apple.COM> kchen@Apple.COM (Kok Chen) writes:
>Theoretical arguments against small antennas are very compelling. (The

Well, I dunno. One of my antenna references (_Antenna Theory and Design_,
W. Stutzman, G. Thiele) does an analysis of a circular loop 0.2 wavelengths
in circumference at 1 MHz. The calculated impedance is 0.316+j285.8. With
copper wire with a conductivity of 5.7E-07 mhos/m, the total input resistance
is calculated at 0.324 ohms. This yields an efficiency of 97.5%. Not bad.
The horizontal radiation pattern (free space) is only slightly inferior to
a dipole in its most favored direction. Again, not bad.

Of course, losses in any network used for matching to the transmission line
aren't considered in this. But it still indicates that small loops *might*
work pretty well. Whether the AEA job does or not is still an open question.
Hopefully, someone out there will actually TEST one and let the rest of us
know.

Ah hah! Another fan of good bad movies! I think it was called "Dangerous
Rescue." It was produced by Zarkoff. We (Jim Blakey and I) use our own
rating scheme:

good/good : Star Wars, Die Hard, etc. A movie that tries to be
a good movie and succeeds.
bad/good : Out Of Africa (IMHO), Star Trek V. A movie that tries
to be a good movie and fails.
good/bad : Toxic Avenger, Killer Klowns. A movie intended to be
bad that succeeds.
bad/bad   : Toxic Avenger II, etc. A movie intended to be bad that
fails. These are the most painful to watch.

See ya at the bad movies! (too bad I can't use my ATV setup to broadcast them locally.)

>
>Perry Scott

IMHO, using a PC as a repeater controller is a good idea, and shouldn't be difficult to implement. PC's are nice because most of the hard work that would normally have to be done in hardware in a non-CPU based repeater can be done in software. Access codes can be easily changed, PROMS don't have to be burned for different CW ID's, the ID's themselves can be generated by the computer, etc. The way I see it, the above caveat can easily be remedied by not using floppy drives/a hard drive in normal operation. The system should be set up so that upon booting, both the control software and all data necessary to run the repeater, including the custom control codes, ID's, messages, etc. should all be loaded into memory to prevent unnecessary use of the disk drive and also to increase speed. But that's probably pretty obvious. I can't think of any real reason why the computer would have to write anything to disk as the repeater is used. What's there to be logged that easily be converted to a digital format that's of any use?

BTW, most of the interfacing can probably be done without having to directly communicate with the computer byte-wise. Control lines on the RS232 port make handy binary lines. Having the computer set lines high is a quick and efficient way of flipping relays, keying CW, etc. They can be used as input as well - have a receiver set the line high when a signal opens squelch. It's a lot easier than having to read and write 8 bits on the data lines and allows for more than one device to be connected

to the computer unlike 2-device serial communications. And if one
port isn't enough, another serial port can be added for about $25.
A stripped-down single-floppy XT clone with 2 serial ports should cost
less than $500 new, probably under $300 used. If money is really
tight, use as C64 (ick) or trash-80.

About the only "real" communications that would be necessary would be
getting DTMF tones from the receiver to the computer. That shouldn't be
all that difficult either. Less than 5 chips in actuality. Take
a DTMF decoder and a UART and you're 99% done. Things like detecting
S/N for voting or detecting PL might be a bit more difficult, but they would
be necessary in a non-computer-based repeater anyway. Control of the
repeater would be simple - just tack on a modem.

If you do decide to go through with the project, keep us posted. I'd
be interested in hearing how you went about the whole project. I'm
sure it's been done many other times before, but it would still
be interesting.

It sure would cut down on the round-table QSO's & networks.

Oh, and the mobile operators might think it was a bit of an imposition.

I would think that Kilowatt ops are more likely to have a beam & tower
already. Either they have more money to spend, or are willing to spend
more of what they have on the hobby.

We have a lot more room with most people running SSB rather than AM, but we didn't have to legislate to accomplish it. People switched for their own reasons (like more bang for the watt).

Not really. My club just got its renewal notice for QEX and I have decided not to renew it. (We are an ARRL-affiliated club, by the way, which has some *teriffic* benefits).

My problem with QEX is redundancy. I have seen an article that says, "Let's have fun and build a 20-meter cw portable tranceiver that works on a 9-volt battery!" SOOOOO many times - this is the sort of thing that belongs in the handbook, and not to pop up in QEX two or three times a year.

>

OK, you've made a positive contribution right there, only two weeks out of the mailbox. (Congrats, BTW!)

Anything a ham does for the public, whether its a courtesy phone patch/remote call, or getting help to someone stranded in a flood or earthquake, is on the plus side.

We need all of that we can get. Good show.

Now. Were those folks (since they were up on a mountain...) part of a club or organization (climbing club, environmentalist organization, whatever?)

Is there a way you can arrange for a presentation at one of their meetings about ham radio? If not yourself, maybe someone from your radio club is not uncomfortable in front of a strange group...

SYSMSGSBE-W-WARNING: SOAPBOX MODE ENGAGED...

That's a little more agressive, and I think that is what Patty and some of us were looking for. I unfortunately, between work and running code practice for the club and helping out with the VE team have plenty to do. If I had about three more nights per week, I'd like to seek out new life and new civi-... oops... new organizations that need programs and present to Lion's Club and Elks and Shriner's and Ladies' Auxiliary of the Volunteer Fire Department... and present ham radio as it is (or as we hope it to be!)

Two things are possible if you do that right...
   (1) Jane and John Q. Public know FOR REAL what ham radio is, not what rumor and misinformation make of it, and
   (2) SOMEBODY might get interested.

(2) is nice, but they're not going to beat your door down. (1) builds a firm foundation on which (2) can build from.

Maybe, maybe not. But it sure can't hurt...if it's done well.

SYSMSGSBE-I-NOTICE: SOAPBOX MODE TERMINATED.

Have fun with your new license. Go try all the neat things you can do, and if you can do a favor for a friend or a stranger, let 'em know it was a HAM who did it!

SB RTTYDX @ RTTYDX $RTDX0622
RTTY DX Notes, 1of3, 6/22/90

RTTY DX Notes for Weekending 22nd June 1990.
Part 1 of 3.
BID: $RTDX0622

The ANARTS contest has come and gone, and if you thought that the propagation was poor for that weekend, you should have a look at it now. Even the intruders are missing. But we have received some logs, and from some of the scores there was little to complain about. Keep the logs coming, chaps.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, OD5NG, PJ2MI, TG9VT, VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster. Thank you all for your assistance. Every little bit helps.

Bandpass:

Friday 15:

UQ2HO	14089	at	0348Z
J73EH	14082	at	0440Z
EA6MQ	14088	at	0516Z

QSL Information:

ED9CI says to QSL via EA9KQ.

T5RM will QSL via HB9RTR, 134 Saules, 1233 Bernex, Switzerland.

HK0BKX (San Andres) via WB9NUL.

FY5DG is at Box 450, Kouru, French Guyana.

SU1HN will QSL via Box 1578, Alf Maskan, Cairo.

EA6MQ will QSL via his Callbook address.

Notes of Interest:

ED9CI was the station that was reported last week as having the callsign of AN9CI. The call was changed at the last moment, but it was still Aure on Chafarinas Island.

YL1WW is in Riga, USSR. No further information at this time.

TV9GIR will be a special call from Margaux Island (north of Bordeaux) on June 23/24. They will operate all bands and modes (including CW on 10 MHz). QSL via FD1MRE or via the bureau.

We appear to be a little short of information this week, but propagation has been very poor, and someone has taken Africa off the map.

GL DE DX1 (VK2EG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips
to VK2SG @ VK2AGE.AUS.AU.

>Is there a television set operating nearby? I get all kinds of RFI from my TV,
>and a bit from the neighbors'. The horizontal oscillator operates at
>15.734 KHz.

Yeah, I get this one, too. Lessee - 30 Mhz is on about the 2000th
harmonic. That's a sharp sawtooth indeed ! Can I put a ferrite bead
on a wire somewhere in the telly to get rid of this ?

My wife finds it ironic she QRMs me as much as I QRM her. :-)

I agree. Magazines don't dream up this stuff - we do. When was the last time you did something original ? If you have a better, cheaper, faster way to do something and don't publish, it's as if you never thought of it at all.

What about me ? I'm working on a cheaper soft-start for high-power (tube) RF amps. Does one already exist ? I don't know - I haven't seen one yet.

By the way, I find this newsgroup to be a powerful counter point to the regular mags. We can say what we want against CQ and QST in an uneditted manner. We can also exchange ideas in a way not possible via a magazine. I even find technically useful information, despite the lack of graphics.

Re: Goodbye Ham Radio Magazine

* I said goodbye to HR some time ago. I feel that they lost the formula that made them successful. The magazine appealed to the more technical portion of the amateur radio population. About three or four years ago, I think they forgot this fact and started watering down their technical content. I had written a couple of articles for them and conversations with their editors began to center more on sure fire idiot proof construction and less on technical content (IMHO).
  At that point I pulled the plug on my subscription,
  so I have no recent experience with HR.

* Wireless World is a really interesting magazine. It has a great mix of electrical engineering, amateur radio, general electronics hobbyist stuff, basic theory and pseudo-science. The downside is 1) ads are for UK products 2) prices are in pounds 3) words like color are spelled 'colour' 4) expensive in the US.

Maybe one slightly different tack is to approach the TEACHERS, make resources
and training availble to them, and offer to assist with transferring it to
the students.

I get the impression a lot of teachers feel tied up with budget constraints and administrative policy.

If you can get one teacher interested in ham radio, that might lead to getting a dozen students involved...

Just a thought!!

73,
Bob

ZCZC AP30
PROPAGATION FORECAST BULLETIN 26 ARLPP026
FROM ED TILTON, W1HDQ
SPRING HILL FL JUNE 25, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS OFF TO A GOOD START EARLY IN JUNE, BUT IT PEAKED AT 217 ON THE 12TH. THIS WAS 51 POINTS BELOW THE YEARS HIGH OF 268 SET ONE MONTH EARLIER. THE SOLAR FLUX THEN SLID BACK TO 133 BY THE 23RD. IT ROSE A BIT ON THE 24TH AND IT MAY BE ON ITS WAY TO HIGHER LEVELS THIS WEEK.

SOME NEW ACTIVITY WAS SEEN IN THE EASTERN PORTION OF THE SUN OVER THE WEEKEND, AND MORE MAY BE SHOWING UP IN THE NEXT FEW DAYS. ITS PROGRESS CAN BE FOLLOWED BY LISTENING TO INFORMATION GIVEN BY WWV AT 18 MINUTES AFTER EACH HOUR.

DESPITE THE LOW SOLAR FLUX, PROPAGATION WAS FAIRLY GOOD LAST WEEK, EXCEPT THAT BANDS ABOVE 21 MHZ MAY HAVE BEEN MARGINAL FOR DX USE AT TIMES WHEN SPORADIC E SKIP WAS IN. IT MAY HAVE BEEN MUCH OF THE TIME AND IT WILL BE WITH US OFTEN WELL INTO JULY, AT LEAST.

E SKIP IS USEFUL FOR MEDIUM DISTANCE WORK ON 28 AND 50 MHZ, AND IT MAY SHOW UP ON 144 MHZ AT TIMES, ESPECIALLY IN JUNE AND EARLY JULY. IT IS LIKELY TO BE VERY ERRATIC AND SHORT LIVED ON 144 MHZ.

AMERICAN SUNSPOT NUMBERS FOR JUNE 14 THROUGH 20 WERE BETWEEN 67 AND 125 WITH A MEAN OF 95.4. AR

>and or mobile transceiver with us. (ICOM-IC24AT and 3210, USA models)
>We would like to use them to meet local hams, as well as for travel advice.
>Are there repeaters on 2M and 440 MHz around those countries as there are here,
>and will our current equipment be fine for accessing them, or do they have
>different requirements for access, such as special tones, or different offsets?

The repeaters in Holland are all located in the 145.6 - 145.775 region, and most of them do not require a tone burst to start them up. The offset is as in the US, -600 Kc for the input frequency. On 70cm most of the repeaters are in the 430.000 - 430.500 region, requiring a +1.6Mc shift for the input frequency. Remember the bandplan is a lot smaller in Holland for 2m and 70cm as it is in the US, but you can easaly find that your reciprocal license (I guess).

>Are the operating procedures on VHF/UHF repeaters similar to in the USA?

When I was over in the US, I noticed no big differences, so I guess they are the same.

>Can we obtain directories of repeaters, before we leave home.

It'll be probably (again) in your receprocal license agreement, but if not, I'm quite willing to help you out.

>What is the required procedure for reciprocal operating privileges?

As I did for Canada and the US, request one. The address, I think, you can use for Holland is:

HDTP/ Directie Operationele Zaken
Postbus 450
9700 AL Groningen
The Netherlands.

Include to speed up the procedure, copies of your US licenses. As noted before, you might have to pay for your license(s)!

>Please reply via email, if possible.

Why personaly, I think it could be of interest for a wider audiance too.

Hope to hear you.

To: info-hams@ucsd.edu

In article <42200@apple.Apple.COM> kchen@Apple.COM (Kok Chen) writes:
>Theoretical arguments against small antennas are very compelling. (The

Well, I dunno. One of my antenna references (_Antenna Theory and Design_, W. Stutzman, G. Thiele) does an analysis of a circular loop 0.2 wavelengths in circumference at 1 MHz. The calculated impedance is 0.316+j285.8. With copper wire with a conductivity of 5.7E-07 mhos/m, the total input resistance is calculated at 0.324 ohms. This yields an efficiency of 97.5%. Not bad. The horizontal radiation pattern (free space) is only slightly inferior to a dipole in its most favored direction. Again, not bad.

Of course, losses in any network used for matching to the transmission line aren't considered in this. But it still indicates that small loops *might* work pretty well. Whether the AEA job does or not is still an open question. Hopefully, someone out there will actually TEST one and let the rest of us know.

Ah hah! Another fan of good bad movies! I think it was called "Dangerous Rescue." It was produced by Zarkoff. We (Jim Blakey and I) use our own rating scheme:

good/good : Star Wars, Die Hard, etc. A movie that tries to be a good movie and succeeds.
bad/good : Out Of Africa (IMHO), Star Trek V. A movie that tries to be a good movie and fails.
good/bad : Toxic Avenger, Killer Klowns. A movie intended to be bad that succeeds.
bad/bad   : Toxic Avenger II, etc. A movie intended to be bad that fails. These are the most painful to watch.

See ya at the bad movies! (too bad I can't use my ATV setup to broadcast them locally.)

Subject: Homebrew repeater controllers
To: info-hams@ucsd.edu

In article <7880166@hpfcdc.HP.COM> perry@hpfcdc.HP.COM (Perry Scott) writes:

> Just a word of caution - disk drives are less rugged than most electronics.
> If the controller spends most of it's time in an air-conditioned shack, it
> should be fine. :-)
>
> Perry Scott

IMHO, using a PC as a repeater controller is a good idea, and shouldn't be difficult to implement. PC's are nice because most of the hard work that would normally have to be done in hardware in a non-CPU based repeater can be done in software. Access codes can be easily changed, PROMS don't have to be burned for different CW ID's, the ID's themselves can be generated by the computer, etc. The way I see it, the above caveat can easily be remedied by not using floppy drives/a hard drive in normal operation. The system should be set up so that upon booting, both the control software and all data necessary to run the repeater, including the custom control codes, ID's, messages, etc. should all be loaded into memory to prevent unnecessary use of the disk drive and also to increase speed. But that's probably pretty obvious. I can't think of any real reason why the computer would have to write anything to disk as the repeater is used. What's there to be logged that easily be converted to a digital format that's of any use?

BTW, most of the interfacing can probably be done without having to directly communicate with the computer byte-wise. Control lines on the RS232 port make handy binary lines. Having the computer set lines high is a quick and efficient way of flipping relays, keying CW, etc. They can be used as input as well - have a receiver set the line high when a signal opens squelch. It's a lot easier than having to read and write 8 bits on the data lines and allows for more than one device to be connected to the computer unlike 2-device serial communications. And if one port isn't enough, another serial port can be added for about $25. A stripped-down single-floppy XT clone with 2 serial ports should cost less than $500 new, probably under $300 used. If money is really tight, use as C64 (ick) or trash-80.

About the only "real" communications that would be necessary would be getting DTMF tones from the receiver to the computer. That shouldn't be all that difficult either. Less than 5 chips in actuality. Take a DTMF decoder and a UART and you're 99% done. Things like detecting S/N for voting or detecting PL might be a bit more difficult, but they would be necessary in a non-computer-based repeater anyway. Control of the repeater would be simple - just tack on a modem.

If you do decide to go through with the project, keep us posted. I'd be interested in hearing how you went about the whole project. I'm sure it's been done many other times before, but it would still be interesting.

It sure would cut down on the round-table QSO's & networks.

Oh, and the mobile operators might think it was a bit of an imposition.

I would think that Kilowatt ops are more likely to have a beam & tower already. Either they have more money to spend, or are willing to spend more of what they have on the hobby.

We have a lot more room with most people running SSB rather than AM, but we didn't have to legislate to accomplish it. People switched for their own reasons (like more bang for the watt).

Not really. My club just got its renewal notice for QEX and I have
decided not to renew it. (We are an ARRL-affiliated club, by the
way, which has some *teriffic* benefits).

My problem with QEX is redundancy. I have seen an article that says,
"Let's have fun and build a 20-meter cw portable tranceiver that works
on a 9-volt battery!" SOOOOO many times - this is the sort of thing
that belongs in the handbook, and not to pop up in QEX two or three
times a year.

OK, you've made a positive contribution right there, only two weeks out of
the mailbox. (Congrats, BTW!)

Anything a ham does for the public, whether its a courtesy phone patch/remote
call, or getting help to someone stranded in a flood or earthquake, is on
the plus side.

We need all of that we can get. Good show.

Now. Were those folks (since they were up on a mountain...) part of a club or organization (climbing club, environmentalist organization, whatever?)

Is there a way you can arrange for a presentation at one of their meetings about ham radio? If not yourself, maybe someone from your radio club is not uncomfortable in front of a strange group...

SYSMSGSBE-W-WARNING: SOAPBOX MODE ENGAGED...

That's a little more agressive, and I think that is what Patty and some of us were looking for. I unfortunately, between work and running code practice for the club and helping out with the VE team have plenty to do. If I had about three more nights per week, I'd like to seek out new life and new civi-... oops... new organizations that need programs and present to Lion's Club and Elks and Shriner's and Ladies' Auxiliary of the Volunteer Fire Department... and present ham radio as it is (or as we hope it to be!)

Two things are possible if you do that right...
   (1) Jane and John Q. Public know FOR REAL what ham radio is, not what rumor and misinformation make of it, and
   (2) SOMEBODY might get interested.

(2) is nice, but they're not going to beat your door down. (1) builds a firm foundation on which (2) can build from.

Maybe, maybe not. But it sure can't hurt...if it's done well.

SYSMSGSBE-I-NOTICE: SOAPBOX MODE TERMINATED.

Have fun with your new license. Go try all the neat things you can do, and if you can do a favor for a friend or a stranger, let 'em know it was a HAM who did it!

RTTY DX Notes for Weekending 22nd June 1990.
Part 1 of 3.
BID: $RTDX0622

The ANARTS contest has come and gone, and if you thought that the propagation was poor for that weekend, you should have a look at it now. Even the intruders are missing. But we have received some logs, and from some of the scores there was little to complain about. Keep the logs coming, chaps.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, OD5NG, PJ2MI, TG9VT, VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster. Thank you all for your assistance. Every little bit helps.

J73EH	14082	at	0440Z
EA6MQ	14088	at	0516Z

QSL Information:

ED9CI says to QSL via EA9KQ.

T5RM will QSL via HB9RTR, 134 Saules, 1233 Bernex, Switzerland.

HK0BKX (San Andres) via WB9NUL.

FY5DG is at Box 450, Kouru, French Guyana.

SU1HN will QSL via Box 1578, Alf Maskan, Cairo.

EA6MQ will QSL via his Callbook address.

Notes of Interest:

ED9CI was the station that was reported last week as having the callsign of AN9CI. The call was changed at the last moment, but it was still Aure on Chafarinas Island.

YL1WW is in Riga, USSR. No further information at this time.

TV9GIR will be a special call from Margaux Island (north of Bordeaux) on June 23/24. They will operate all bands and modes (including CW on 10 MHz). QSL via FD1MRE or via the bureau.

We appear to be a little short of information this week, but propagation has been very poor, and someone has taken Africa off the map.

GL DE DX1 (VK2EG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

I agree. Magazines don't dream up this stuff - we do. When was the
last time you did something original ? If you have a better, cheaper,
faster way to do something and don't publish, it's as if you never

thought of it at all.

What about me ? I'm working on a cheaper soft-start for high-power (tube) RF amps. Does one already exist ? I don't know - I haven't seen one yet.

By the way, I find this newsgroup to be a powerful counter point to the regular mags. We can say what we want against CQ and QST in an uneditted manner. We can also exchange ideas in a way not possible via a magazine. I even find technically useful information, despite the lack of graphics.

Re: Goodbye Ham Radio Magazine

* I said goodbye to HR some time ago. I feel that they lost the formula that made them successful. The magazine appealed to the more technical portion of the amateur radio population. About three or four years ago, I think they forgot this fact and started watering down their technical content. I had written a couple of articles for them and conversations with their editors began to center more on sure fire idiot proof construction and less on technical content (IMHO). At that point I pulled the plug on my subscription, so I have no recent experience with HR.

* Wireless World is a really interesting magazine. It has a great mix of electrical engineering, amateur radio, general electronics hobbyist stuff, basic theory and pseudo-science. The downside is 1) ads are for UK products 2) prices are in pounds 3) words like color are spelled 'colour' 4) expensive in the US.

(Chad Fogg)
Subject: HDTV and Waveform Modulation
To: info-hams@ucsd.edu

A new term to add to the HDTV glossary, waveform modulation is given
a brief mention in the July 1990 issue of _Video_Magazine_, page 50.

According to the article, Production Services, Inc. of Tuscon, Arizona
claims they can "squeeze a full-blown HDTV signal and a conventional
NTSC signal within the same 6 MHz frequency channel" by using "a new

modulation technology to add information to the spectrum without interference."

Richard Gerdes, PSI co-founder, explains that their technique "alters the shape of the carrier and transmits the result of that altered wave shape."

At the NTSC level:

PSI gas already developed a commercial product using waveform modulation for NTSC broadcasts: an encoder and decoder that allows an NTSC station to broadcast two channels simultaneously from one transmitter. "You could tune to channel 4A or 4B using the decoder," Gerdes says. The FCC has already granted an experimental license for channel 11 in Tuscon, a Fox Network affiliate, to begin testing the system.

Article aside, has anyone in Tuscon seen this? Any elaborations on waveform modulation; PSI's technology? And does WM have implications for other EM-based communications?

> were running about 1 KW! Made me feel just *fine*.

That is correct. The difference between 20 watts and 1000 watts is 13 db or about 2 S-units. A good antenna in a good QTH can make much more of a difference. The difference between someone that the gods of propagation are smiling on and someone that they are not can be 60 db or more.

I remember on night working about 50 east european stations in a row. They said that I was the only W/K station that they could hear. This was not due to monster antennas or high power. It was mostly the dumb luck of being exactly where the opening was. Sill, it was great to be the target of a pileup for once.

P.S. My attitude to DXCC is, if I happen to work them great, if not, no big deal. I have about 125 confirmed countries. Almost all of them came back on the first or second call and QSL via the buro. After all, ham radio should be fun. If you are not having fun do something else.

Maybe one slightly different tack is to approach the TEACHERS, make resources and training availble to them, and offer to assist with transferring it to the students.

I get the impression a lot of teachers feel tied up with budget constraints and administrative policy.

If you can get one teacher interested in ham radio, that might lead to getting a dozen students involved...

Just a thought!!

73,
Bob

ZCZC AP30
PROPAGATION FORECAST BULLETIN 26 ARLPP026
FROM ED TILTON, W1HDQ
SPRING HILL FL JUNE 25, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS OFF TO A GOOD START EARLY IN JUNE, BUT IT PEAKED AT 217 ON THE 12TH. THIS WAS 51 POINTS BELOW THE YEARS HIGH OF 268 SET ONE MONTH EARLIER. THE SOLAR FLUX THEN SLID BACK TO 133 BY THE 23RD. IT ROSE A BIT ON THE 24TH AND IT MAY BE ON ITS WAY TO HIGHER LEVELS THIS WEEK.

SOME NEW ACTIVITY WAS SEEN IN THE EASTERN PORTION OF THE SUN OVER THE WEEKEND, AND MORE MAY BE SHOWING UP IN THE NEXT FEW DAYS. ITS PROGRESS CAN BE FOLLOWED BY LISTENING TO INFORMATION GIVEN BY WWV AT 18 MINUTES AFTER EACH HOUR.

DESPITE THE LOW SOLAR FLUX, PROPAGATION WAS FAIRLY GOOD LAST WEEK, EXCEPT THAT BANDS ABOVE 21 MHZ MAY HAVE BEEN MARGINAL FOR DX USE AT TIMES WHEN SPORADIC E SKIP WAS IN. IT MAY HAVE BEEN MUCH OF THE TIME AND IT WILL BE WITH US OFTEN WELL INTO JULY, AT LEAST.

E SKIP IS USEFUL FOR MEDIUM DISTANCE WORK ON 28 AND 50 MHZ, AND IT MAY SHOW UP ON 144 MHZ AT TIMES, ESPECIALLY IN JUNE AND EARLY JULY. IT IS LIKELY TO BE VERY ERRATIC AND SHORT LIVED ON 144 MHZ.

AMERICAN SUNSPOT NUMBERS FOR JUNE 14 THROUGH 20 WERE BETWEEN 67 AND 125 WITH A MEAN OF 95.4. AR

WB8ELK's BALLOON Launch carrying LIVE ATV is going on as scheduled. The launch net will be on 40 meters LSB 7155 KHz. "CAP COMM" will be WA3USG. Net will commence at 8:30 AM EDT with launch expected at 9:00 AM EDT. Video will be on 439.25 (CABLE CH 60). Beacon frequency 144.34.

Bill (WB8ELK) is inviting everyone out to the launch sight to view the launch. Bill is also in need of some people with FOX HUNTING skills to help with the recovery. If you can help please contact him direct at 73 Mag Phone: 603-525-4201.

If you view the video or hear the beacon please get in touch with Bill. He will certainly want to get reception reports.

>and or mobile transceiver with us. (ICOM-IC24AT and 3210, USA models)
>We would like to use them to meet local hams, as well as for travel advice.
>Are there repeaters on 2M and 440 MHz around those countries as there are here,
>and will our current equipment be fine for accessing them, or do they have
>different requirements for access, such as special tones, or different offsets?

The repeaters in Holland are all located in the 145.6 - 145.775 region, and most of them do not require a tone burst to start them up. The offset is as in the US, -600 Kc for the input frequency. On 70cm most of the repeaters are in the 430.000 - 430.500 region, requiring a +1.6Mc shift for the input frequency. Remember the bandplan is a lot smaller in Holland for 2m and 70cm as it is in the US, but you can easaly find that your reciprocal license (I guess).

>Are the operating procedures on VHF/UHF repeaters similar to in the USA?

When I was over in the US, I noticed no big differences, so I guess they are the same.

>Can we obtain directories of repeaters, before we leave home.

It'll be probably (again) in your receprocal license agreement, but if not, I'm quite willing to help you out.

>What is the required procedure for reciprocal operating privileges?

As I did for Canada and the US, request one. The address, I think, you can use for Holland is:

HDTP/ Directie Operationele Zaken
Postbus 450
9700 AL Groningen
The Netherlands.

Include to speed up the procedure, copies of your US licenses. As noted before, you might have to pay for your license(s)!

>Please reply via email, if possible.

Why personaly, I think it could be of interest for a wider audiance too.

Hope to hear you.

To: info-hams@ucsd.edu

In article <42200@apple.Apple.COM> kchen@Apple.COM (Kok Chen) writes:
>Theoretical arguments against small antennas are very compelling. (The

Well, I dunno. One of my antenna references (_Antenna Theory and Design_, W. Stutzman, G. Thiele) does an analysis of a circular loop 0.2 wavelengths in circumference at 1 MHz. The calculated impedance is 0.316+j285.8. With copper wire with a conductivity of 5.7E-07 mhos/m, the total input resistance is calculated at 0.324 ohms. This yields an efficiency of 97.5%. Not bad. The horizontal radiation pattern (free space) is only slightly inferior to a dipole in its most favored direction. Again, not bad.

Of course, losses in any network used for matching to the transmission line aren't considered in this. But it still indicates that small loops *might* work pretty well. Whether the AEA job does or not is still an open question. Hopefully, someone out there will actually TEST one and let the rest of us know.

Ah hah! Another fan of good bad movies! I think it was called "Dangerous Rescue." It was produced by Zarkoff. We (Jim Blakey and I) use our own rating scheme:

good/good : Star Wars, Die Hard, etc. A movie that tries to be a good movie and succeeds.
bad/good : Out Of Africa (IMHO), Star Trek V. A movie that tries to be a good movie and fails.
good/bad : Toxic Avenger, Killer Klowns. A movie intended to be bad that succeeds.
bad/bad : Toxic Avenger II, etc. A movie intended to be bad that

fails. These are the most painful to watch.
See ya at the bad movies! (too bad I can't use my ATV setup to broadcast them locally.)

In article <7880166@hpfcdc.HP.COM> perry@hpfcdc.HP.COM (Perry Scott) writes:
>Just a word of caution - disk drives are less rugged than most electronics.
>If the controller spends most of it's time in an air-conditioned shack, it
>should be fine. :-)
>
>Perry Scott

IMHO, using a PC as a repeater controller is a good idea, and shouldn't be difficult to implement. PC's are nice because most of the hard work that would normally have to be done in hardware in a non-CPU based repeater can be done in software. Access codes can be easily changed, PROMS don't have to be burned for different CW ID's, the ID's themselves can be generated by the computer, etc. The way I see it, the above caveat can easily be remedied by not using floppy drives/a hard drive in normal operation. The system should be set up so that upon booting, both the control software and all data necessary to run the repeater, including the custom control codes, ID's, messages, etc. should all be loaded into memory to prevent unnecessary use of the disk drive and also to increase speed. But that's probably pretty obvious. I can't think of any real reason why the computer would have to write anything to disk as the repeater is used. What's there to be logged that easily be converted to a digital format that's of any use?

BTW, most of the interfacing can probably be done without having to directly communicate with the computer byte-wise. Control lines on the RS232 port make handy binary lines. Having the computer set lines high is a quick and efficient way of flipping relays, keying CW, etc. They can be used as input as well - have a receiver set the line high when a signal opens squelch. It's a lot easier than having to read and write 8 bits on the data lines and allows for more than one device to be connected to the computer unlike 2-device serial communications. And if one port isn't enough, another serial port can be added for about $25.
A stripped-down single-floppy XT clone with 2 serial ports should cost less than $500 new, probably under $300 used. If money is really tight, use as C64 (ick) or trash-80.

About the only "real" communications that would be necessary would be getting DTMF tones from the receiver to the computer. That shouldn't be all that difficult either. Less than 5 chips in actuality. Take a DTMF decoder and a UART and you're 99% done. Things like detecting S/N for voting or detecting PL might be a bit more difficult, but they would be necessary in a non-computer-based repeater anyway. Control of the repeater would be simple - just tack on a modem.

If you do decide to go through with the project, keep us posted. I'd be interested in hearing how you went about the whole project. I'm sure it's been done many other times before, but it would still be interesting.

It sure would cut down on the round-table QSO's & networks.

Oh, and the mobile operators might think it was a bit of an imposition.

I would think that Kilowatt ops are more likely to have a beam & tower already. Either they have more money to spend, or are willing to spend more of what they have on the hobby.

We have a lot more room with most people running SSB rather than AM, but we didn't have to legislate to accomplish it. People switched for their own reasons (like more bang for the watt).

Not really. My club just got its renewal notice for QEX and I have decided not to renew it. (We are an ARRL-affiliated club, by the way, which has some *teriffic* benefits).

My problem with QEX is redundancy. I have seen an article that says, "Let's have fun and build a 20-meter cw portable tranceiver that works on a 9-volt battery!" SOOOOO many times - this is the sort of thing that belongs in the handbook, and not to pop up in QEX two or three times a year.

>

OK, you've made a positive contribution right there, only two weeks out of the mailbox. (Congrats, BTW!)

Anything a ham does for the public, whether its a courtesy phone patch/remote call, or getting help to someone stranded in a flood or earthquake, is on the plus side.

We need all of that we can get. Good show.

Now. Were those folks (since they were up on a mountain...) part of a club or organization (climbing club, environmentalist organization, whatever?)

Is there a way you can arrange for a presentation at one of their meetings about ham radio? If not yourself, maybe someone from your radio club is not uncomfortable in front of a strange group...

SYSMSGSBE-W-WARNING: SOAPBOX MODE ENGAGED...

That's a little more agressive, and I think that is what Patty and some of us were looking for. I unfortunately, between work and running code practice for the club and helping out with the VE team have plenty to do. If I had about three more nights per week, I'd like to seek out new life and new civi-... oops... new organizations that need programs and present to Lion's Club and Elks and Shriner's and Ladies' Auxiliary of the Volunteer Fire Department... and present ham radio as it is (or as we hope it to be!)

Two things are possible if you do that right...
   (1) Jane and John Q. Public know FOR REAL what ham radio is, not what rumor and misinformation make of it, and
   (2) SOMEBODY might get interested.

(2) is nice, but they're not going to beat your door down. (1) builds a firm foundation on which (2) can build from.

Maybe, maybe not. But it sure can't hurt...if it's done well.

SYSMSGSBE-I-NOTICE: SOAPBOX MODE TERMINATED.

Have fun with your new license. Go try all the neat things you can do, and if you can do a favor for a friend or a stranger, let 'em know it was a HAM who did it!

73,

RTTY DX Notes, 1of3, 6/22/90

RTTY DX Notes for Weekending 22nd June 1990.
Part 1 of 3.
BID: $RTDX0622

The ANARTS contest has come and gone, and if you thought that the propagation was poor for that weekend, you should have a look at it now. Even the intruders are missing. But we have received some logs, and from some of the scores there was little to complain about. Keep the logs coming, chaps.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, OD5NG, PJ2MI, TG9VT, VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster. Thank you all for your assistance. Every little bit helps.

Bandpass:

Thursday 21:

UQ2HO	14089	at	0348Z
J73EH	14082	at	0440Z
EA6MQ	14088	at	0516Z

QSL Information:

ED9CI says to QSL via EA9KQ.

T5RM will QSL via HB9RTR, 134 Saules, 1233 Bernex, Switzerland.

HK0BKX (San Andres) via WB9NUL.

FY5DG is at Box 450, Kouru, French Guyana.

SU1HN will QSL via Box 1578, Alf Maskan, Cairo.

EA6MQ will QSL via his Callbook address.

Notes of Interest:

ED9CI was the station that was reported last week as having the callsign of AN9CI. The call was changed at the last moment, but it was still Aure on Chafarinas Island.

YL1WW is in Riga, USSR. No further information at this time.

TV9GIR will be a special call from Margaux Island (north of Bordeaux) on June 23/24. They will operate all bands and modes (including CW on 10 MHz). QSL via FD1MRE or via the bureau.

We appear to be a little short of information this week, but propagation has been very poor, and someone has taken Africa off the map.

GL DE DX1 (VK2EG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

>Is there a television set operating nearby? I get all kinds of RFI from my TV,
>and a bit from the neighbors'. The horizontal oscillator operates at
>15.734 KHz.

Yeah, I get this one, too. Lessee - 30 Mhz is on about the 2000th
harmonic. That's a sharp sawtooth indeed ! Can I put a ferrite bead
on a wire somewhere in the telly to get rid of this ?

My wife finds it ironic she QRMs me as much as I QRM her. :-)

I agree. Magazines don't dream up this stuff - we do. When was the last time you did something original ? If you have a better, cheaper, faster way to do something and don't publish, it's as if you never thought of it at all.

What about me ? I'm working on a cheaper soft-start for high-power (tube) RF amps. Does one already exist ? I don't know - I haven't seen one yet.

By the way, I find this newsgroup to be a powerful counter point to the regular mags. We can say what we want against CQ and QST in an uneditted manner. We can also exchange ideas in a way not possible via a magazine. I even find technically useful information, despite the lack of graphics.

Re: Goodbye Ham Radio Magazine

* I said goodbye to HR some time ago. I feel that they lost the formula that made them successful. The magazine appealed to the more technical portion of the amateur radio population. About three or four years ago, I think they forgot this fact and started watering down their technical content. I had written a couple of articles for them and conversations with their editors began to center more on sure fire idiot proof construction and less on technical content (IMHO).
  At that point I pulled the plug on my subscription, so I have no recent experience with HR.

* Wireless World is a really interesting magazine. It has a great mix of electrical engineering, amateur radio, general electronics hobbyist stuff, basic theory and pseudo-science. The downside is 1) ads are for UK products 2) prices are in pounds 3) words like color are spelled 'colour' 4) expensive in the US.

(Chad Fogg)
Subject: HDTV and Waveform Modulation
To: info-hams@ucsd.edu

A new term to add to the HDTV glossary, waveform modulation is given
a brief mention in the July 1990 issue of _Video_Magazine_, page 50.

According to the article, Production Services, Inc. of Tuscon, Arizona claims they can "squeeze a full-blown HDTV signal and a conventional NTSC signal within the same 6 MHz frequency channel" by using "a new modulation technology to add information to the spectrum without interference."

Richard Gerdes, PSI co-founder, explains that their technique "alters the shape of the carrier and transmits the result of that altered wave shape."

At the NTSC level:

> PSI gas already developed a commercial product using waveform modulation for NTSC broadcasts: an encoder and decoder that allows an NTSC station to broadcast two channels simultaneously from one transmitter. "You could tune to channel 4A or 4B using the decoder," Gerdes says. The FCC has already granted an experimental license for channel 11 in Tuscon, a Fox Network affiliate, to begin testing the system.

Article aside, has anyone in Tuscon seen this? Any elaborations on waveform modulation; PSI's technology? And does WM have implications for other EM-based communications?

>   I was running a Uniden 2510 with no amp and told me I was
>   not only 59+ but louder than some fellows who told him they
>   were running about 1 KW! Made me feel just *fine*.

That is correct. The difference between 20 watts and 1000 watts is 13 db or about 2 S-units. A good antenna in a good QTH can make much more of a difference. The difference between someone that the gods of propagation are smiling on and someone that they are not can be 60 db or more.

I remember on night working about 50 east european stations in a row. They said that I was the only W/K station that they could hear. This was not due to monster antennas or high power. It was mostly the dumb luck of being exactly where the opening was. Sill, it was great to be the target of a pileup for once.

P.S. My attitude to DXCC is, if I happen to work them great, if not, no big deal. I have about 125 confirmed countries. Almost all of them came back on the first or second call and QSL via the buro. After all, ham radio should be fun. If you are not having fun do something else.

Well, what do you think would be the effect of a mass mailing telling the ARRL what we would like to see in QST? All of us sitting on here saying QST's ok, BUT... That doesn't fix the problem!

I think it needs to be BIGGER! Not necessarily in size, but content! Have you ever noticed that fully ONE-HALF!!! of QST is ads? It's really a bit more than that, considering the ads that come between articles and such. That's pathetic!! I subscribe because I feel I need to keep a leg in somehow but it IS a bit sad! It's almost like BYTE!

Where's the beef? I agree... we need more technical stuff!!! I wonder how many people subscribed to Ham Radio. If someone started up a strictly "high-tech" ham magazine, I wonder how much support they could realistically expect. As was mentioned before... the mag can only be as good as its submissions!

Maybe one slightly different tack is to approach the TEACHERS, make resources and training availble to them, and offer to assist with transferring it to the students.

I get the impression a lot of teachers feel tied up with budget constraints and administrative policy.

If you can get one teacher interested in ham radio, that might lead to getting a dozen students involved...

Just a thought!!

73,
Bob

SPRING HILL FL JUNE 25, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS OFF TO A GOOD START EARLY IN JUNE, BUT IT PEAKED AT 217 ON THE 12TH. THIS WAS 51 POINTS BELOW THE YEARS HIGH OF 268 SET ONE MONTH EARLIER. THE SOLAR FLUX THEN SLID BACK TO 133 BY THE 23RD. IT ROSE A BIT ON THE 24TH AND IT MAY BE ON ITS WAY TO HIGHER LEVELS THIS WEEK.

SOME NEW ACTIVITY WAS SEEN IN THE EASTERN PORTION OF THE SUN OVER THE WEEKEND, AND MORE MAY BE SHOWING UP IN THE NEXT FEW DAYS. ITS PROGRESS CAN BE FOLLOWED BY LISTENING TO INFORMATION GIVEN BY WWV AT 18 MINUTES AFTER EACH HOUR.

DESPITE THE LOW SOLAR FLUX, PROPAGATION WAS FAIRLY GOOD LAST WEEK, EXCEPT THAT BANDS ABOVE 21 MHZ MAY HAVE BEEN MARGINAL FOR DX USE AT TIMES WHEN SPORADIC E SKIP WAS IN. IT MAY HAVE BEEN MUCH OF THE TIME AND IT WILL BE WITH US OFTEN WELL INTO JULY, AT LEAST.

E SKIP IS USEFUL FOR MEDIUM DISTANCE WORK ON 28 AND 50 MHZ, AND IT MAY SHOW UP ON 144 MHZ AT TIMES, ESPECIALLY IN JUNE AND EARLY JULY. IT IS LIKELY TO BE VERY ERRATIC AND SHORT LIVED ON 144 MHZ.

AMERICAN SUNSPOT NUMBERS FOR JUNE 14 THROUGH 20 WERE BETWEEN 67 AND 125 WITH A MEAN OF 95.4. AR

To: info-hams@ucsd.edu

WB8ELK's BALLOON Launch carrying LIVE ATV is going on as scheduled. The launch net will be on 40 meters LSB 7155 KHz. "CAP COMM" will be WA3USG. Net will commence at 8:30 AM EDT with launch expected at 9:00 AM EDT. Video will be on 439.25 (CABLE CH 60). Beacon frequency 144.34.

Bill (WB8ELK) is inviting everyone out to the launch sight to view the launch. Bill is also in need of some people with FOX HUNTING skills to help with the recovery. If you can help please contact him direct at 73 Mag Phone: 603-525-4201.

If you view the video or hear the beacon please get in touch with Bill. He will certainly want to get reception reports.

>We are planning a vacation to Denmark and the Netherlands this summer.
>My wife and I are both licensed hams and we would like to bring our HT
>and or mobile transceiver with us. (ICOM-IC24AT and 3210, USA models)
>We would like to use them to meet local hams, as well as for travel advice.
>Are there repeaters on 2M and 440 MHz around those countries as there are here,
>and will our current equipment be fine for accessing them, or do they have
>different requirements for access, such as special tones, or different offsets?

The repeaters in Holland are all located in the 145.6 - 145.775 region, and most of them do not require a tone burst to start them up. The offset is as in the US, -600 Kc for the input frequency. On 70cm most of the repeaters are in the 430.000 - 430.500 region, requiring a +1.6Mc shift for the input frequency. Remember the bandplan is a lot smaller in Holland for 2m and 70cm as it is in the US, but you can easaly find that your reciprocal license (I guess).

>Are the operating procedures on VHF/UHF repeaters similar to in the USA?

When I was over in the US, I noticed no big differences, so I guess they are the same.

>Can we obtain directories of repeaters, before we leave home.

It'll be probably (again) in your receprocal license agreement, but if not, I'm quite willing to help you out.

>What is the required procedure for reciprocal operating privileges?

As I did for Canada and the US, request one. The address, I think, you can use for Holland is:

HDTP/ Directie Operationele Zaken
Postbus 450
9700 AL Groningen
The Netherlands.

Include to speed up the procedure, copies of your US licenses. As noted before, you might have to pay for your license(s)!

>Please reply via email, if possible.

Why personaly, I think it could be of interest for a wider audiance too.

Hope to hear you.

Subject: Dubious quality of CQ review of AEA IsoLoop
To: info-hams@ucsd.edu

In article <42200@apple.Apple.COM> kchen@Apple.COM (Kok Chen) writes:
>Theoretical arguments against small antennas are very compelling. (The

Well, I dunno. One of my antenna references (_Antenna Theory and Design_, W. Stutzman, G. Thiele) does an analysis of a circular loop 0.2 wavelengths in circumference at 1 MHz. The calculated impedance is 0.316+j285.8. With copper wire with a conductivity of 5.7E-07 mhos/m, the total input resistance is calculated at 0.324 ohms. This yields an efficiency of 97.5%. Not bad. The horizontal radiation pattern (free space) is only slightly inferior to a dipole in its most favored direction. Again, not bad.

Of course, losses in any network used for matching to the transmission line aren't considered in this. But it still indicates that small loops *might* work pretty well. Whether the AEA job does or not is still an open question. Hopefully, someone out there will actually TEST one and let the rest of us know.

>But, what was the name of this movie? I want to rent it!
>

Ah hah! Another fan of good bad movies! I think it was called "Dangerous Rescue." It was produced by Zarkoff. We (Jim Blakey and I) use our own rating scheme:

```
     good/good : Star Wars, Die Hard, etc.  A movie that tries to be
              a good movie and succeeds.
     bad/good  : Out Of Africa (IMHO), Star Trek V. A movie that tries
              to be a good movie and fails.
     good/bad  : Toxic Avenger, Killer Klowns.  A movie intended to be
              bad that succeeds.
     bad/bad   : Toxic Avenger II, etc. A movie intended to be bad that
              fails.  These are the most painful to watch.
```

See ya at the bad movies! (too bad I can't use my ATV setup to broadcast them locally.)

```

Subject: Homebrew repeater controllers
To: info-hams@ucsd.edu

In article <7880166@hpfcdc.HP.COM> perry@hpfcdc.HP.COM (Perry Scott) writes:
>Just a word of caution - disk drives are less rugged than most electronics.
>If the controller spends most of it's time in an air-conditioned shack, it
>should be fine. :-)
>
>Perry Scott

IMHO, using a PC as a repeater controller is a good idea, and shouldn't be difficult to implement. PC's are nice because most of the hard work that would normally have to be done in hardware in a non-CPU based repeater can be done in software. Access codes can be easily changed, PROMS don't have to be burned for different CW ID's, the ID's themselves can be generated by the computer, etc. The way I see it, the above caveat can easily be remedied by not using floppy drives/a hard drive in normal operation. The system should be set up so that upon booting, both the control software and all data necessary to run the repeater, including the custom control codes, ID's, messages, etc. should all be loaded into memory to prevent unnecessary use of the disk drive and also to increase speed. But that's probably pretty obvious. I can't think of any real reason why the computer would have to write anything to disk as the repeater is used. What's there to be logged that easily be converted to a digital format that's of any use?

BTW, most of the interfacing can probably be done without having to directly communicate with the computer byte-wise. Control lines on the RS232 port make handy binary lines. Having the computer set lines high is a quick and efficient way of flipping relays, keying CW, etc. They can be used as input as well - have a receiver set the line high when a signal opens squelch. It's a lot easier than having to read and write 8 bits on the data lines and allows for more than one device to be connected to the computer unlike 2-device serial communications. And if one port isn't enough, another serial port can be added for about $25. A stripped-down single-floppy XT clone with 2 serial ports should cost less than $500 new, probably under $300 used. If money is really tight, use as C64 (ick) or trash-80.

About the only "real" communications that would be necessary would be getting DTMF tones from the receiver to the computer. That shouldn't be all that difficult either. Less than 5 chips in actuality. Take a DTMF decoder and a UART and you're 99% done. Things like detecting S/N for voting or detecting PL might be a bit more difficult, but they would be necessary in a non-computer-based repeater anyway. Control of the repeater would be simple - just tack on a modem.

If you do decide to go through with the project, keep us posted. I'd be interested in hearing how you went about the whole project. I'm sure it's been done many other times before, but it would still be interesting.

It sure would cut down on the round-table QSO's & networks.

Oh, and the mobile operators might think it was a bit of an imposition.

I would think that Kilowatt ops are more likely to have a beam & tower already. Either they have more money to spend, or are willing to spend more of what they have on the hobby.

We have a lot more room with most people running SSB rather than AM, but we didn't have to legislate to accomplish it. People switched for their own reasons (like more bang for the watt).

Not really. My club just got its renewal notice for QEX and I have decided not to renew it. (We are an ARRL-affiliated club, by the way, which has some *teriffic* benefits).

My problem with QEX is redundancy. I have seen an article that says, "Let's have fun and build a 20-meter cw portable tranceiver that works on a 9-volt battery!" SOOOOO many times - this is the sort of thing that belongs in the handbook, and not to pop up in QEX two or three times a year.

>

OK, you've made a positive contribution right there, only two weeks out of
the mailbox. (Congrats, BTW!)

Anything a ham does for the public, whether its a courtesy phone patch/remote call, or getting help to someone stranded in a flood or earthquake, is on the plus side.

We need all of that we can get. Good show.

Now. Were those folks (since they were up on a mountain...) part of a club or organization (climbing club, environmentalist organization, whatever?)

Is there a way you can arrange for a presentation at one of their meetings about ham radio? If not yourself, maybe someone from your radio club is not uncomfortable in front of a strange group...

SYSMSGSBE-W-WARNING: SOAPBOX MODE ENGAGED...

That's a little more agressive, and I think that is what Patty and some of us were looking for. I unfortunately, between work and running code practice for the club and helping out with the VE team have plenty to do. If I had about three more nights per week, I'd like to seek out new life and new civi-... oops... new organizations that need programs and present to Lion's Club and Elks and Shriner's and Ladies' Auxiliary of the Volunteer Fire Department... and present ham radio as it is (or as we hope it to be!)

Two things are possible if you do that right...

(1) Jane and John Q. Public know FOR REAL what ham radio is, not what rumor and misinformation make of it, and
(2) SOMEBODY might get interested.

(2) is nice, but they're not going to beat your door down. (1) builds a

firm foundation on which (2) can build from.

Maybe, maybe not. But it sure can't hurt...if it's done well.

SYSMSGSBE-I-NOTICE: SOAPBOX MODE TERMINATED.

Have fun with your new license. Go try all the neat things you can do, and if you can do a favor for a friend or a stranger, let 'em know it was a HAM who did it!

RTTY DX Notes, 1of3, 6/22/90

RTTY DX Notes for Weekending 22nd June 1990.
Part 1 of 3.
BID: $RTDX0622

The ANARTS contest has come and gone, and if you thought that the propagation was poor for that weekend, you should have a look at it now. Even the intruders are missing. But we have received some logs, and from some of the scores there was little to complain about. Keep the logs coming, chaps.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, OD5NG, PJ2MI, TG9VT, VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster. Thank you all for your assistance. Every little bit helps.

EA6MQ	14088	at	0516Z

QSL Information:

ED9CI says to QSL via EA9KQ.

T5RM will QSL via HB9RTR, 134 Saules, 1233 Bernex, Switzerland.

HK0BKX (San Andres) via WB9NUL.

FY5DG is at Box 450, Kouru, French Guyana.

SU1HN will QSL via Box 1578, Alf Maskan, Cairo.

EA6MQ will QSL via his Callbook address.

Notes of Interest:

ED9CI was the station that was reported last week as having the callsign of AN9CI. The call was changed at the last moment, but it was still Aure on Chafarinas Island.

YL1WW is in Riga, USSR. No further information at this time.

TV9GIR will be a special call from Margaux Island (north of Bordeaux) on June 23/24. They will operate all bands and modes (including CW on 10 MHz). QSL via FD1MRE or via the bureau.

We appear to be a little short of information this week, but propagation has been very poor, and someone has taken Africa off the map.

GL DE DX1 (VK2EG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

I agree. Magazines don't dream up this stuff - we do. When was the last time you did something original ? If you have a better, cheaper, faster way to do something and don't publish, it's as if you never thought of it at all.

What about me ? I'm working on a cheaper soft-start for high-power (tube) RF amps. Does one already exist ? I don't know - I haven't seen one yet.

By the way, I find this newsgroup to be a powerful counter point to the regular mags. We can say what we want against CQ and QST in an uneditted manner. We can also exchange ideas in a way not possible via a magazine. I even find technically useful information, despite the lack of graphics.

Perry Scott, KF0CA

Re: Goodbye Ham Radio Magazine

* I said goodbye to HR some time ago. I feel that they lost the formula that made them successful. The magazine appealed to the more technical portion of the amateur radio population. About three or four years ago, I think they forgot this fact and started watering down their technical content. I had written a couple of articles for them and conversations with their editors began to center more on sure fire idiot proof construction and less on technical content (IMHO). At that point I pulled the plug on my subscription, so I have no recent experience with HR.

* Wireless World is a really interesting magazine. It has a great mix of electrical engineering, amateur radio, general electronics hobbyist stuff, basic theory and pseudo-science. The downside is 1) ads are for UK products 2) prices are in pounds 3) words like color are spelled 'colour' 4) expensive in the US.

Subject: HDTV and Waveform Modulation
To: info-hams@ucsd.edu

A new term to add to the HDTV glossary, waveform modulation is given a brief mention in the July 1990 issue of _Video_Magazine_, page 50.

According to the article, Production Services, Inc. of Tuscon, Arizona claims they can "squeeze a full-blown HDTV signal and a conventional NTSC signal within the same 6 MHz frequency channel" by using "a new modulation technology to add information to the spectrum without interference."

Richard Gerdes, PSI co-founder, explains that their technique "alters the shape of the carrier and transmits the result of that altered wave shape."

At the NTSC level:

> PSI gas already developed a commercial product using waveform modulation for NTSC broadcasts: an encoder and decoder that allows an NTSC station to broadcast two channels simultaneously from one transmitter. "You could tune to channel 4A or 4B using the decoder," Gerdes says. The FCC has already granted an experimental license for channel 11 in Tuscon, a Fox Network affiliate, to begin testing the system.

Article aside, has anyone in Tuscon seen this? Any elaborations on waveform modulation; PSI's technology?   And does WM have implications for other EM-based communications?

That is correct. The difference between 20 watts and 1000 watts is 13 db or about 2 S-units. A good antenna in a good QTH can make much more of a difference. The difference between someone that the gods of propagation are smiling on and someone that they are not can be 60 db or more.

I remember on night working about 50 east european stations in a row. They said that I was the only W/K station that they could hear. This was not due to monster antennas or high power. It was mostly the dumb luck of being exactly where the opening was. Sill, it was great to be the target of a pileup for once.

P.S. My attitude to DXCC is, if I happen to work them great, if not, no big deal. I have about 125 confirmed countries. Almost all of them came back on the first or second call and QSL via the buro. After all, ham radio should be fun. If you are not having fun do something else.

Maybe one slightly different tack is to approach the TEACHERS, make resources
and training availble to them, and offer to assist with transferring it to
the students.

I get the impression a lot of teachers feel tied up with budget constraints
and administrative policy.

If you can get one teacher interested in ham radio, that might lead to getting
a dozen students involved...

Just a thought!!

73,
Bob

ZCZC AP30
PROPAGATION FORECAST BULLETIN 26 ARLPP026
FROM ED TILTON, W1HDQ
SPRING HILL FL JUNE 25, 1990

TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS OFF TO A GOOD START EARLY IN JUNE, BUT IT PEAKED AT 217 ON THE 12TH. THIS WAS 51 POINTS BELOW THE YEARS HIGH OF 268 SET ONE MONTH EARLIER. THE SOLAR FLUX THEN SLID BACK TO 133 BY THE 23RD. IT ROSE A BIT ON THE 24TH AND IT MAY BE ON ITS WAY TO HIGHER LEVELS THIS WEEK.

SOME NEW ACTIVITY WAS SEEN IN THE EASTERN PORTION OF THE SUN OVER THE WEEKEND, AND MORE MAY BE SHOWING UP IN THE NEXT FEW DAYS. ITS PROGRESS CAN BE FOLLOWED BY LISTENING TO INFORMATION GIVEN BY WWV AT 18 MINUTES AFTER EACH HOUR.

DESPITE THE LOW SOLAR FLUX, PROPAGATION WAS FAIRLY GOOD LAST WEEK, EXCEPT THAT BANDS ABOVE 21 MHZ MAY HAVE BEEN MARGINAL FOR DX USE AT TIMES WHEN SPORADIC E SKIP WAS IN. IT MAY HAVE BEEN MUCH OF THE TIME AND IT WILL BE WITH US OFTEN WELL INTO JULY, AT LEAST.

E SKIP IS USEFUL FOR MEDIUM DISTANCE WORK ON 28 AND 50 MHZ, AND IT MAY SHOW UP ON 144 MHZ AT TIMES, ESPECIALLY IN JUNE AND EARLY JULY. IT IS LIKELY TO BE VERY ERRATIC AND SHORT LIVED ON 144 MHZ.

AMERICAN SUNSPOT NUMBERS FOR JUNE 14 THROUGH 20 WERE BETWEEN 67 AND 125 WITH A MEAN OF 95.4. AR

>and or mobile transceiver with us. (ICOM-IC24AT and 3210, USA models)
>We would like to use them to meet local hams, as well as for travel advice.
>Are there repeaters on 2M and 440 MHz around those countries as there are here,
>and will our current equipment be fine for accessing them, or do they have
>different requirements for access, such as special tones, or different offsets?

The repeaters in Holland are all located in the 145.6 - 145.775 region, and most of them do not require a tone burst to start them up. The offset is as in the US, -600 Kc for the input frequency. On 70cm most of the repeaters are in the 430.000 - 430.500 region, requiring a +1.6Mc shift for the input frequency. Remember the bandplan is a lot smaller in Holland for 2m and 70cm as it is in the US, but you can easaly find that your reciprocal license (I guess).

>Are the operating procedures on VHF/UHF repeaters similar to in the USA?

When I was over in the US, I noticed no big differences, so I guess they are the same.

>Can we obtain directories of repeaters, before we leave home.

It'll be probably (again) in your receprocal license agreement, but if not, I'm quite willing to help you out.

>What is the required procedure for reciprocal operating privileges?

As I did for Canada and the US, request one. The address, I think, you can use for Holland is:

HDTP/ Directie Operationele Zaken
Postbus 450
9700 AL Groningen
The Netherlands.

Include to speed up the procedure, copies of your US licenses. As noted before, you might have to pay for your license(s)!

>Please reply via email, if possible.

Why personaly, I think it could be of interest for a wider audiance too.

Hope to hear you.

>Theoretical arguments against small antennas are very compelling. (The

Well, I dunno. One of my antenna references (_Antenna Theory and Design_, W. Stutzman, G. Thiele) does an analysis of a circular loop 0.2 wavelengths in circumference at 1 MHz. The calculated impedance is 0.316+j285.8. With copper wire with a conductivity of 5.7E-07 mhos/m, the total input resistance is calculated at 0.324 ohms. This yields an efficiency of 97.5%. Not bad. The horizontal radiation pattern (free space) is only slightly inferior to a dipole in its most favored direction. Again, not bad.

Of course, losses in any network used for matching to the transmission line aren't considered in this. But it still indicates that small loops *might* work pretty well. Whether the AEA job does or not is still an open question. Hopefully, someone out there will actually TEST one and let the rest of us know.

Ah hah! Another fan of good bad movies! I think it was called "Dangerous Rescue." It was produced by Zarkoff. We (Jim Blakey and I) use our own rating scheme:

good/good : Star Wars, Die Hard, etc. A movie that tries to be a good movie and succeeds.
bad/good : Out Of Africa (IMHO), Star Trek V. A movie that tries to be a good movie and fails.
good/bad : Toxic Avenger, Killer Klowns. A movie intended to be bad that succeeds.
bad/bad : Toxic Avenger II, etc. A movie intended to be bad that fails. These are the most painful to watch.

See ya at the bad movies! (too bad I can't use my ATV setup to broadcast them locally.)

>Perry Scott

IMHO, using a PC as a repeater controller is a good idea, and shouldn't be difficult to implement. PC's are nice because most of the hard work that would normally have to be done in hardware in a non-CPU based repeater can be done in software. Access codes can be easily changed, PROMS don't have to be burned for different CW ID's, the ID's themselves can be generated by the computer, etc. The way I see it, the above caveat can easily be remedied by not using floppy drives/a hard drive in normal operation. The system should be set up so that upon booting, both the control software and all data necessary to run the repeater, including the custom control codes, ID's, messages, etc. should all be loaded into memory to prevent unnecessary use of the disk drive and also to increase speed. But that's probably pretty obvious. I can't think of any real reason why the computer would have to write anything to disk as the repeater is used. What's there to be logged that easily be converted to a digital format that's of any use?

BTW, most of the interfacing can probably be done without having to directly communicate with the computer byte-wise. Control lines on the RS232 port make handy binary lines. Having the computer set lines high is a quick and efficient way of flipping relays, keying CW, etc. They can be used as input as well - have a receiver set the line high when a signal opens squelch. It's a lot easier than having to read and write 8 bits on the data lines and allows for more than one device to be connected to the computer unlike 2-device serial communications. And if one port isn't enough, another serial port can be added for about $25. A stripped-down single-floppy XT clone with 2 serial ports should cost less than $500 new, probably under $300 used. If money is really tight, use as C64 (ick) or trash-80.

About the only "real" communications that would be necessary would be getting DTMF tones from the receiver to the computer. That shouldn't be all that difficult either. Less than 5 chips in actuality. Take a DTMF decoder and a UART and you're 99% done. Things like detecting S/N for voting or detecting PL might be a bit more difficult, but they would be necessary in a non-computer-based repeater anyway. Control of the repeater would be simple - just tack on a modem.

If you do decide to go through with the project, keep us posted. I'd be interested in hearing how you went about the whole project. I'm sure it's been done many other times before, but it would still be interesting.

>antenna's - it's amazing.

>We'd have *alot* more room on our bands if people used directional antennas
>and ran reduced power. The latter would force the fomer somewhat.

It sure would cut down on the round-table QSO's & networks.

Oh, and the mobile operators might think it was a bit of an imposition.

I would think that Kilowatt ops are more likely to have a beam & tower
already. Either they have more money to spend, or are willing to spend
more of what they have on the hobby.

We have a lot more room with most people running SSB rather than AM,
but we didn't have to legislate to accomplish it. People switched for
their own reasons (like more bang for the watt).

Not really. My club just got its renewal notice for QEX and I have
decided not to renew it. (We are an ARRL-affiliated club, by the
way, which has some *teriffic* benefits).

My problem with QEX is redundancy. I have seen an article that says,
"Let's have fun and build a 20-meter cw portable tranceiver that works
on a 9-volt battery!" SOOOOO many times - this is the sort of thing
that belongs in the handbook, and not to pop up in QEX two or three
times a year.

>
> Well I've only been Tech-licensed a week and a half, but one thing I do is help people make phone calls to friends from the top of 14000' mountains. If that doesn't stimulate interest, I dunno what will.
>

OK, you've made a positive contribution right there, only two weeks out of the mailbox. (Congrats, BTW!)

Anything a ham does for the public, whether its a courtesy phone patch/remote call, or getting help to someone stranded in a flood or earthquake, is on the plus side.

We need all of that we can get. Good show.

Now. Were those folks (since they were up on a mountain...) part of a club or organization (climbing club, environmentalist organization, whatever?)

Is there a way you can arrange for a presentation at one of their meetings about ham radio? If not yourself, maybe someone from your radio club is not uncomfortable in front of a strange group...

SYSMSGSBE-W-WARNING: SOAPBOX MODE ENGAGED...

That's a little more agressive, and I think that is what Patty and some of us were looking for. I unfortunately, between work and running code practice for the club and helping out with the VE team have plenty to do. If I had about three more nights per week, I'd like to seek out new life and new civi-... oops... new organizations that need programs and present to Lion's Club and Elks and Shriner's and Ladies' Auxiliary of the Volunteer Fire Department... and present ham radio as it is (or as we hope it to be!)

Two things are possible if you do that right...
   (1) Jane and John Q. Public know FOR REAL what ham radio is, not what rumor and misinformation make of it, and
   (2) SOMEBODY might get interested.

(2) is nice, but they're not going to beat your door down. (1) builds a firm foundation on which (2) can build from.

Maybe, maybe not. But it sure can't hurt...if it's done well.

SYSMSGSBE-I-NOTICE: SOAPBOX MODE TERMINATED.

Have fun with your new license. Go try all the neat things you can do, and if you can do a favor for a friend or a stranger, let 'em know it was a HAM who did it!

RTTY DX Notes, 1of3, 6/22/90

RTTY DX Notes for Weekending 22nd June 1990.
Part 1 of 3.
BID: $RTDX0622

The ANARTS contest has come and gone, and if you thought that the propagation was poor for that weekend, you should have a look at it now. Even the intruders are missing. But we have received some logs, and from some of the scores there was little to complain about. Keep the logs coming, chaps.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, OD5NG, PJ2MI, TG9VT, VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster. Thank you all for your assistance. Every little bit helps.

Thursday 21:

UQ2HO	14089	at	0348Z
J73EH	14082	at	0440Z
EA6MQ	14088	at	0516Z

QSL Information:

ED9CI says to QSL via EA9KQ.

T5RM will QSL via HB9RTR, 134 Saules, 1233 Bernex, Switzerland.

HK0BKX (San Andres) via WB9NUL.

FY5DG is at Box 450, Kouru, French Guyana.

SU1HN will QSL via Box 1578, Alf Maskan, Cairo.

EA6MQ will QSL via his Callbook address.

Notes of Interest:

ED9CI was the station that was reported last week as having the callsign of AN9CI. The call was changed at the last moment, but it was still Aure on Chafarinas Island.

YL1WW is in Riga, USSR. No further information at this time.

TV9GIR will be a special call from Margaux Island (north of Bordeaux) on June 23/24. They will operate all bands and modes (including CW on 10 MHz). QSL via FD1MRE or via the bureau.

We appear to be a little short of information this week, but propagation has been very poor, and someone has taken Africa off the map.

GL DE DX1 (VK2EG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

>15.734 KHz.

Yeah, I get this one, too. Lessee - 30 Mhz is on about the 2000th harmonic. That's a sharp sawtooth indeed ! Can I put a ferrite bead on a wire somewhere in the telly to get rid of this ?

My wife finds it ironic she QRMs me as much as I QRM her. :-)

I agree. Magazines don't dream up this stuff - we do. When was the last time you did something original ? If you have a better, cheaper, faster way to do something and don't publish, it's as if you never thought of it at all.

What about me ? I'm working on a cheaper soft-start for high-power (tube) RF amps. Does one already exist ? I don't know - I haven't seen one yet.

By the way, I find this newsgroup to be a powerful counter point to the regular mags. We can say what we want against CQ and QST in an uneditted manner. We can also exchange ideas in a way not possible via a magazine. I even find technically useful information, despite the lack of graphics.

Re: Goodbye Ham Radio Magazine

* I said goodbye to HR some time ago. I feel that they lost the formula that made them successful. The magazine appealed to the more technical portion of the amateur radio population. About three or four years ago, I think they forgot this fact and started watering down their technical content. I had written

a couple of articles for them and conversations with their editors began to center more on sure fire idiot proof construction and less on technical content (IMHO).
At that point I pulled the plug on my subscription, so I have no recent experience with HR.

- Wireless World is a really interesting magazine. It has a great mix of electrical engineering, amateur radio, general electronics hobbyist stuff, basic theory and pseudo-science. The downside is 1) ads are for UK products 2) prices are in pounds 3) words like color are spelled 'colour' 4) expensive in the US.

Subject: HDTV and Waveform Modulation
To: info-hams@ucsd.edu

A new term to add to the HDTV glossary, waveform modulation is given a brief mention in the July 1990 issue of _Video_Magazine_, page 50.

According to the article, Production Services, Inc. of Tuscon, Arizona claims they can "squeeze a full-blown HDTV signal and a conventional NTSC signal within the same 6 MHz frequency channel" by using "a new modulation technology to add information to the spectrum without interference."

Richard Gerdes, PSI co-founder, explains that their technique "alters the shape of the carrier and transmits the result of that altered wave shape."

At the NTSC level:

> PSI gas already developed a commercial product using waveform modulation for NTSC broadcasts: an encoder and decoder that allows an NTSC station to broadcast two channels simultaneously from one transmitter. "You could tune to channel 4A or 4B using the decoder," Gerdes says. The FCC has already granted an experimental license for channel 11 in Tuscon, a Fox Network affiliate, to begin testing the system.

Article aside, has anyone in Tuscon seen this? Any elaborations on waveform modulation; PSI's technology? And does WM have implications for other EM-based communications?

> I was running a Uniden 2510 with no amp and told me I was
> not only 59+ but louder than some fellows who told him they
> were running about 1 KW! Made me feel just *fine*.

That is correct. The difference between 20 watts and 1000 watts is 13 db or about 2 S-units. A good antenna in a good QTH can make much more of a difference. The difference between someone that the gods of propagation are smiling on and someone that they are not can be 60 db or more.

I remember on night working about 50 east european stations in a row. They said that I was the only W/K station that they could hear. This was not due to monster antennas or high power. It was mostly the dumb luck of being exactly where the opening was. Sill, it was great to be the target of a pileup for once.

P.S. My attitude to DXCC is, if I happen to work them great, if not, no big deal. I have about 125 confirmed countries. Almost all of them came back on the first or second call and QSL via the buro. After all, ham radio should be fun. If you are not having fun do something else.

One thing I did when I became SM of Utah in '83 was to have some buisness cards printed up with the ARRL logo in red (the SM color). Besides handing these out at club meetings and ham fests I also used them whenever I lent a hand to an organization or an individual. Stopping by the road to help a stranded motorist call for assistance or ringing up a patch during a race I always indicated that I was a RADIO HAM not a CB, I then gave them one of my cards and made a short statment that we were always glad to help out.

I have only heard this third hand, but rumor has it that Jim, V31BB, has died in Belize. For those unfamiliar with him, he was probably best known as the voice of the MFJ junk net, which was a nice platform for him to expound on the evils of buying equipment from the MFJ corp.

Having only spoken to him once, but having listened to V31BB alot, this rumor is going to need lots of checking before it can truly be believed. One story is that his death was due to electric shock while working on his amplifier.

If anyone knows any more about this, please give us the info!

The item called an OCTOPUS can actually have two applications. In the first case it is totally legal, it is an old term for a power cord. The illegal version is an interlock system which enables a team with multipul transmitters to abide by the rule which prohibits a single transmitter team from transmitting on more than one transmitter at a time. The interlock works like this:

The transmit buttons are all interlocked such that the first station pushing a transmit button locks out all others from transmitting until he releases his button. When he is finished then the nest request is honored. Often these have an override function which enables a station to transmit until he explicitly releases the lockout. This is by ARRL FD rules totally illegal as not complying with the spirit of the definition of single transmitter class. The concept could be expanded to several transmitter setups but would be equally illegal.

I know it takes a lot more letters but why not write to the advertizers??
A few well composed suggestions to some of the bigger advertizers might
just put some pressure where it might do some good. That coupled with
reduced subscription lists ?could? have an effect. CQ Used (c 1945-1970)
to be a reasonable good rag. I still think we should push for a quarterly
tech journal along the lines of what HR used to be (and 73 also before
Wayne lost a fair amount of his common sense). A quarterly couldn't put
too much burden to the publishing buisness, they would have the ability
to select really prime tech stuff and put out a good quality mag, something
with less half-tone and a darned sight less glitz.

SB ALL @ AMSAT $ANS-174.01
EUROPEAN FIELD DAY

HR AMSAT NEWS SERVICE BULLETIN 174.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 23, 1990
TO ALL RADIO AMATEURS BT

While amateurs in North America were involved in Field Day '90 (scores of stations were working AO-13 alone!), plans were underway for a similar emergency communications test in Europe the following weekend. AMSAT Education Advisor, Rich Ensign (N8IWJ) relays the following details:

Jurgen, DG7NBH reports that hams in the Nurenberg, West Germany area are gathering for their annual test of emergency operations on June 30, 1990. Jurgen and his group have a special emphasis this year. They are calling their event an "American Activity Day." American hams living in the Nurenberg area are being invited to the operations site to share in contacting as many stations in the U.S. as possible. Jurgen will have his Mode B OSCAR station on site and he will be found on OSCAR 13 on a downlink frequency of 145.925 MHz between 20:00 and 22:30 UTC. At that time there is an excellent window between the U. S. and Europe. Why not give DG7NBH a call!

SB ALL @ AMSAT $ANS-174.02
ZRO TEST SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 174.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 23, 1990
TO ALL RADIO AMATEURS BT

Last ZRO Test of the Current Set to be Held Last Saturday in June

You have one more chance to test out your receive station on AO-13 during the latest round of The ZRO Memorial Technical Achievement Award Program. The "ZRO Test", which is a test of operating skill and equipment performance, has been run over the past few weeks and will conclude at the end of June.

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" tests on 435.945 MHz.

Saturday June 30, 1990 at 1840 UTC "JL"
Saturday June 30, 1990 at 1930 UTC "B"

Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures, means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

SB ALL @ AMSAT $ANS-174.03
OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 174.03 FROM AMSAT HQ
SILVER SPRING, MD JUNE 23, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date UTC	Time	Phs	Mode	NCS	U.S. Day
26 Jun 90	0115	144	B	N5BF	Monday
Orientation Change to 210/0					
09 Jul 90	0000	184	B	N5BF	Sunday
16 Jul 90	0115	130	B	N5BF	Sunday
27 Jul 90	0030	130	B	N5BF	Thursday

For information on the amateur satellite program and how you can participate, contact AMSAT-NA at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

SB ALL @ AMSAT $ANS-174.04
AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 174.04 FROM AMSAT HQ
SILVER SPRING, MD JUNE 23, 1990
TO ALL RADIO AMATEURS BT

Transponder Schedule for AO-13 Effective 05MAY90

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130 (Mode S Beacon only)
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

The current attitude is:

BLON = 179.4 and BLAT = -4.1 for 25 Jun 90

Cross mode B and S QSOs are possible during MA 135 to 140.

AO-10's Mode-B Transponder Now Available for Use:

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

[AO-10 update received from Graham Ratcliff, VK5AGR, via AO-13 beacons.]

How about a wide-band/packet approach... digitize and send the blocks to rptr.
assume the rotation speed of the antennas (2 will be needed, similar
to a radar scanner I have in the basement at the moment) is 30 rpm, continuous.
Digitize your voice into .5 second segments at 3K sps (12 K samples per
rotation). Transmit the last 8 segments at 500K to 1M bps to the repeater,
and hopefully, it can receive and interleave your packets with everyone elses,
transmitting all of them for the next 2 rotations (oldest get dropped).
You receive these packets and reconstruct the audio. Limited full duplex
with the problems of missed packets, of course.
Transmit only when you hear the repeater spewing packets.
A small bit-slice machine should be able to keep up doing the packet
reassembly.

Is Roger (VE3RKS) in on this? Say hi for me.

Howdy Folks!!

I have just discovered this newsgroup and it has prompted me to ask a few questions about rigs for cw. I have been inactive for about 10 years now due to school (college and grad school), and since an end of school isn't in sight, I figured that I would try to get back into hamming and not wait. I am most interested in cw, sort of a purist perhaps. Looking at the rigs over the past years and with the addition and implementations of the new bands from WARC '79 has made me desire a new rig.

My old (and I think still working) rig is a Heathkit HW101 from about '73 I think. It has 80, 40, 20, 15, and 10 meters on it. The only controls are the rf, af, filter, and tuning knobs (final amp and VFO). It sort of makes me laugh comparing it to what is available now. The receiver has a 0.36 microvolt sensitivity I seem to recall.

Now the questions. What, if any, of the new bells and whistles are really useful to the cw op (I do use SSB at times too.). RIT seems handy, as does the notch filter. Does variable passband and those sorts of controls help?   I would like to have full break-in. What are the memories used for? Are they mostly for the general coverage mode of usage?

Lastly, what rigs would you recommend and why? I seem to recall that things like the Drake CR-7 were good, but they don't seem to exist anymore. What if I reask this question with the stipulation that the price be less than $1000. What could I sell the HW101 for?

Thanks for your help!!

Hmm. I thought that, once you transmitted on a band, you had to stay
on that band for at least 15 minutes.

Just picked up the latest issue of '73 after being somewhat disappointed
with my gratuitous copy of CQ - and besides, '73 was focused on DF which
I find interesting.

In an editorial or publisher's note, the '73 folk said they planned to
help make up for the demise of HR with more technical content. Anyone
want to review the latest '73?

Radio shack has informed me that they have discontinued the SSI2102 touch tone decoder IC from the retail line. They could not tell me whether or not the part would be available on order.

It may be worthwhile for all hams to comb the local radio shack's now, as any that are still left in stock will probably be half price ($5-6 range).

Unfortunately, these chips are not easy to come by ... DTMF decoders are not listed by Digikey, JDR Microdevices, Jameco, or any of the other "standby's". The alternative - building DTMF decoders out of eight (seven if you don't care about ABCD tones) 567's - is messy and a pain in the neck to align properly.

```

This is an attempt to document all of the known key sequences for the ICOM IC24AT (144/440MHz dual band hand held). Some key sequences may be common with the IC[2,3,4]SAT, therefore a few key sequences for those radios are also on this list. Some key sequences require options (such as the PL encode/decode board).

This is not designed to replace the owners manual, but to summarize the information in one place.

Note: Many controls vary depending on the current mode, i.e.: Scan up/down will search frequencies when in VFO mode, and will scan memory channels when in Memory mode. Consult the owners guide for complete information.

```
KEY/COMBINATION = Result, action
---------------   -------------------------------------------------------------
0-9,A,B,C,D,#,* = note: when transmitting these will generate DTMF tones
0-9             = Enter frequency (can also use the VFO knob)
A               = VFO mode / clear incomplete entry
B               = Memory mode
C               = VHF / UHF change
D               = Call channel
*               = Step frequency down/scan down
#               = Step frequency up/scan up
MONI            = Open squelch and change to input frequency (if not simplex)
                   while button is depressed
H/L/DTMF        = Select High/Low power, or (while transmitting) send
                   preprogrammed DTMF codes

FUNC + 0        = Dial set
FUNC + 1        = PL enable (when option is installed)
FUNC + 2        = Code squelch [NOT for the IC24AT, IC[2,3,4]SAT option only]
FUNC + 3        = Skip memory
```

FUNC + 4 = Duplex operation
FUNC + 5 = Code [NOT for the IC24AT, IC[2,3,4]SAT option only]
FUNC + 6 = Mask frequency
FUNC + 7 = Priority mode on/off (operation dependent on current mode)
FUNC + 8 = Set mode (several different functions, press A to exit)
FUNC + 9 = Real time clock and timer functions (press PTT to exit)
FUNC + A = Memory to VFO transfer
FUNC + B = Memory Write
FUNC + C = Split operation (cross band full duplex)
FUNC + D = Lock mode / Cross Band Repeat disable
FUNC + * = Scan programmed limits (down)
FUNC + # = Scan programmed limits (up)
FUNC + 5 + D = Cross Band Repeat enable (split mode must be on!) Diode D14 (right diode on CPU board) must be removed to enable the use of this function)
FUNC + MONI = RX/TX light enable / disable
FUNC + H/L/DTMF = Select DTMF Autodialer memory
Func + VFO knob = Change frequency/memory channel (according to dial set, see FUNC+0)
Func + LIGHT = Lock light on (don't time out)

H/L/DTMF + VFO knob = Change output power (4 power levels when using 13.8 vdc)

The following key combinations selects "power on modes". Start with the radio OFF, then hold down the indicated keys, and continue to hold them while turning the power ON. Some 'modes' override others.

LIGHT + * = PTT enable
LIGHT + 0 = PTT Disabled (inhibits the transmitter, good security method)
LIGHT + 1 = 1 MHz digit set (4 digit frequency entry)
LIGHT + 2 = 10 MHz digit set (5 digit frequency entry)
LIGHT + 3 = 100 MHz digit set (6 digit frequency entry)
LIGHT + 4 = Scan pause until signal disappears
LIGHT + 5 = Scan pause for 10 seconds
LIGHT + 6 = ???? Unknown action
LIGHT + 7 = Power Save deactivated (use this for packet operation)
LIGHT + 8 = Power Save (minimum - 0.125 / 0.5 second)
LIGHT + 9 = Power Save (maximum - 0.125 / 2.0 seconds)
LIGHT + A = ???? Unknown action
LIGHT + B = ???? Unknown action
LIGHT + C = ???? Unknown action
LIGHT + D = ???? Unknown action
LIGHT + # = ???? Unknown action
LIGHT + B + # = RX Extended Range enable This requires that diode D13 is removed (left diode on CPU board). Note that this diode has already been removed by ICOM at the factory on many units. Be sure to hold these keys down until the activity display stops and is showing a receive frequency.

FUNC + A = Reset the CPU (this will clear all the memory channels to the factory defaults)

```

Since the chip is made by SSI, I'd imagine that some of the better distributors that carry SSI components would still have them. If not, there are lot of companies that make DTMF decoders for the sole purpose of repeater control. They can't be all that expensive. With the expanding use of DTMF for controlling devices like phone answering machines or even BSR remote control power switches, they should still be pretty easy to find. I have a couple of the SSI chips from Radio Shack and for $7.77, which is what I paid, you can't beat the deal. If you can still find them, grab a few. They are definately worth it.

I'm looking at possible mobile rigs. This TS440 seems
to be able to do everything. I have no experience
with Kenwoods. Does anyone have any complaints about it?
Limitations? Common difficulties? Reliability?

Is it an exceptional rig?

Thanks for the comments.

Mark!

You are a hot-out-of-the-gate engineer (didn't you say communications technology?) with what should be cutting-edge awareness of what's out there in the "high-tech" world.

What would it take for YOU, YES, YOU! to write an article for such a publication (be it QST or QEX or HAM RADIO-if-it-were-resurrected, whatever) on some topic of interest to amateurs?

Do it!

Convince yourself that nobody else is gonna do it.

Then do it.

THAT is what it takes. Not "somebody oughta..." but "I will...".

Seriously.

I'm not kidding, :-)'ing, flaming, or being sarcastic.

REALLY!

> FT-411E (versus the 411)?

No, but thanks to Mark Bramwell I have the 411 mods, and can forward if anyone wants a copy. What's different about the 411E?

Anybody try the 411 mods, and if so, how did it go? Also, has anybody adjusted the image filter to center at about 152MHz instead of 144MHz, to improve the terrible sensitivity in the 155-166 range?

lewine@dg.dg.com (Don Lewine) claims that...

>>The difference between 20 watts and 1000 watts is 13 db or
>>about 2 S-units.

It's not, it's a factor of 50, which is 17 db, basically 3 S-points. Face it, if you are called by someone who is S5 and someone who is S8 you are usually going to answer the S8 person. But if the only person calling you is S5 then you hear and answer them. So yes, you can work a lot of DX on low power if you know when to keep trying and when to give up.   In a recent contest I lowered the power to 5 watts and worked all continents (those Big Stations have good antennas and good ops and they will hear you eventually). But having done that, I admit that I raised the power again and went searching for new countries.

QRP is fun, but it many cases QRO is funner :-)

Hi Gang,

Guess we all received a big disappointment upon receiving the latest copy of CQ. Years ago, I took CQ and enjoyed its technical content. Can't believe the change! Judging from the editorial, the magazine will never return to a technical format.

I've taken Ham Radio Magazine since its inception and have provided technical articles to it over the years. It was a fine magazine and I too, suffer the loss.

HR and 73 have been good "technical" friends, but at different levels. I hope 73 continues to survive as it is the only remaining "user" written technical magazine that we have. Hopefully, 73 will begin to publish some of the more technical articles that previously went to HR and now no longer have a home.

It would be my suggestion that subscriptions be pulled from CQ and placed with 73 along with a note indicating the need to pick-up technical articles from former HR authors. At the moment, this course of action may be the only way to save our technical forum. I recognize that it would be difficult for 73 to shift from the current less technical format, but perhaps one or more HR level technical articles in each issue would work out OK.

```

A group of local amateurs led by N4CLA has developed a controller based on a plugin board for the PC. It digitizes the receiver output, processes it, and converts it back to analog for the transmitter. It is roughly a DSP system with shared dual ported memory that allows voice mail, a dynamic voice detection type squelch, touchtone detection and generation, and over 200 commands. It will work in any PC, even the original IBM PC1, and it can be used without the PC if you don't need voice mail.

They have installed it on two repeaters so far and plan to introduce it commercially at the upcoming Atlanta Hamfest. It is a very flexible system with very high quality audio.

I am of the school that says "two wires make a light" and don't feel the need to have such a powerful controller. However for those who feel the need, this thing is a technical marvel.

Some real world experience. We have been using PCs for packet switches
on mountain tops for over two years. Hard disk drives have been the
MOST reliable part of our installations. Of course we are using old
5 to 10 megabyte clunkers that have broad tracks and loose tolerances,
but we have had absolutely zero failures in unconditioned radio huts.
What does fail is the floppy drive. The diskette disintigrates in
summer with the oxide peeling off and plating onto the heads. In
winter the diskette gets so brittle that it fails. So don't leave
a diskette at the site if you want it to survive.

> I have an idea. Eliminate voice as a legal mode in Amateur radio.
>
> Al N1AL

This may sound like a subtle dig to the the no-code folks but it may become a viable solution in the not so distant future. If the Amateur Radio Service continues to deteriorate in quality and the number of illegal operators continues to expand at their current rates, the HF spectrum will become enough of a problem to the other services that the politicos will have to act. To head off the total banning of Amateur Radio, the ARRL, FCC etc. might offer to ban the voice mode where the problem exists and give up the voice spectrum without a fight. In other words, bribe the power brokers to leave us with at least a minimal amount of spectrum and the CW/digital modes. This would make enforcement of a ban on illegal radio transmissions easier as any voice transmission would be illegal. Further, the small amount of relatively unobtrusive CW/digital the air would cause few problems and would bring little attention to itself.
I have a feeling that, under this scenario, there would be good deal of technological advancement in CW and the digital modes and at least the technical and educational basis for Amateur Radio would survive. One of the arguments for no-code is that CW is outmoded. Well, in the digital age SSB is outmoded or will be soon as new hardware based DSP technology comes on line. So melt down your D-104s OM's. The days of shouting into a mike at your good buddies across town are coming to an end.

See you on the narrow bandwidth, high throughput modes OM's. Its happening now.

>More seriously, QST edited out a portion of my letter to the editor on the
>3Y5 mess that implied that the ARRL DXCC program was due a share of the blame.

This should surprise no one. The ARRL has a quite notorious past history of trying to surpress opposing points of view - but don't just take my word for it, go look it up for yourself. Check around - while you will find that the ARRL has done a lot of good things for Amateur radio, some of the abuses of their own membership is simply appalling.

>Does anyone else think that the DXCC endorsement/Honor Roll program contributes
>to the overly competitive, work em at any cost attitude that also leads to
>jamming? How about a DXCC for 100 countries and no further endorsements?

John, I've said it before and I'll say it again here. It isn't just any one award that is responsible for this totally disgusting behavior. It is an attitude which you summed up quite nicely and accurately - "...work em at any cost..."

I have stated openly for some time that many hams simply write a check for their QSO's. By that, I mean that they decide they want to achieve a certain award or a certain "level" of recognition and they go out and buy equipment that is sufficiently powerful enough to do the job. Now if they were buying equipment that fell within the "just powerful enough" concept, that would be fine. But NOOOOOOOO, they have to go out and buy the Kilowatt, the tower and the mega-antenna.

What happens? Simple! All it takes is for a few of these guys to get into the same pileup for a station, and the poor schmuck that everybody WANTS to QSO with can hear ONLY the kilowatt hams! So what can the rest do - THEY go out and buy the KW, assuming they can afford it, just to be heard. And those of us who don't run that power level can never get through to a DX station Because of all the kilowatters covering us up.

One time I had the satisfaction of turning this situation around. I was sitting with my measly 20 watts on top of a mountain in the Smokies and encountered a pileup with a New Zealand ham - I put up my call at the appropriate time and he responded immediately. He didn't believe that I was running a Uniden 2510 with no amp and told me I was not only 59+ but louder than some fellows who told him they were running about 1 KW! Made me feel just *fine*.

Now that, of course, does not mean that I intend to move into the mountains just to get a DX QSO now and then. I *do* occasionally run into very considerate types who will periodically ASK for QRP stations only. Compared to a KW I do consider myself QRP. I wish more stations both stateside and DX would do this and give the little guys a chance.

This ties in perfectly with what you are saying - there is a real bad attitude in Amateur radio (and NO, it isn't everyone....) that says make the QSO no matter what you have to do because by God! I paid for that piece of spectrum and by God! I own it!!!!! This attitude is pure crapola and is, IMHO, the source of a great deal of the malicious QRM that is going on.

I think the majority of hams aren't guilty of the worst offenses but by their silence they contribute to the problem. If enough of us screamed bloody murder to the FCC about some of the more obnoxious cases, you bet something would be done about it. But not enough of us do scream, so the FCC figures it isn't a big enough problem for them to waste manpower on.

For a supposedly self-policing service we are doing a pretty lousy job of it.

If the interference shows up on ALL bands, then see if your receiver has a built-in loopstick antenna that's used for the lower frequency bands. If so, you can use the fact that there's a sharp decrease in signal strength with the signal hits these antennas end-on. If the inteference is fairly local, like a neighbor's television set, then you can walk around the area, take bearings, and triangulate to find the source of the interference.

What would be the bandpass curves of simple coaxial 1/4 wave shorting stubs attached to a T-connector? 1 of them? 2 of them spaced apart?

I am wanting to use some 1/4 shorting stubs for static dissipation and lightning protection, but would like to have some flexibility in the transmit range (we are talking <= 25w and typically <= 5w). I'd like to cover the whole 144-148 Mhz band if I can. Filtration is NOT my goal, but rather the ability to dissipate some static electricity. Resistors are out as they are destroyable components for surges. I also am planning to build this for 154-159 Mhz for some local public service radios in use.

I'd also like to know if anyone has tried this for dual-band use, and how good a bandpass can be had for both 144-148 and 440-450 (not exactly 3:1 ratio but close). I'm thinking to aim for the 147/441 Mhz harmonic pair as the center frequency. How high would my Q be on UHF as a 3/4 stub?

Apparently the Motorola 3N211 dual gate fet has higher gain than the
standard issue 3SK40 used in the front end and the mixer of the FT101E.
Does anybody have any experience swapping the 3N211 for the 3SK40 in
the Yaesu FT101 series of transceivers.

Is there a television set operating nearby?  I get all kinds of RFI from my TV,
and a bit from the neighbors'.  The horizontal oscillator operates at
15.734 KHz.  A high-voltage sawtooth makes a wonderful harmonics generator.
The interference is modulated at 60 Hz by the picture brightness.  On my
SW receiver it sounds like a buzz that changes in loudness when the TV scene
changes.

]Are there any members of the Amateur Auxiliary here? What ability does the
](ahem) AA :-) have to help control this sort of crap that's going on on 20M
]and elsewhere? I would love to get in on such an activity. Just tuning
]around, I hear so much garbage and feel helpless to do anything about it, as
]many others have stated here.
Yes, am a member of Amateur Auxiliary (OOC, AZ). There's not a damn
thing we can do about the problem on 20 meters. The AA basically
has three ways of dealing with these sorts of problems:
  (1) Education - let an offender know that he/she is in violation of
      either FCC rules or good amateur practice.
  (2) Peer Pressure - let an offender know that he/she is not going to
      get approval from other amateurs for his/her activities.
  (3) Assist the FCC in gathering information necessary for
      a prosecution.

When there are people who are very familiar with the rules and with
standard amateur practice, and who don't give a damn what other
people think, (1) and (2) don't work. We all know the problems with
#3.

]
]How does the Auxiliary work? I guess I can whip out the Handbook. Hmmm...
]precious little. It refers to an article in QST of Aug '84.
]
]But hey, if we all write to our section managers (the guys that control the
]Auxiliary for their area) and find out about this, maybe we CAN do something!
]
]I'm not one to advocate "tattling" on a fellow ham, but if he is deliberately
]abusing the privilege, than screw it! Let the FCC know and hope that $1000
]fine does the trick!

Don't go to the FCC. Do go to your SM and get involved in the AA program.
]
]What do you all say? I have not heard of ANYONE being in the Aux., nor have I
]heard any mention of it in all my many years of hamming. (1.5, to be
]precise!) :-)

It's not our job to make a lot of noise. It also varies greatly from
one ARRL section to another.

Like many others who have commented lately about the dubious quality of CQ
magazine, I feel a great loss at the demise of Ham Radio Magazine. When I
read that HR had been sold to CQ in last month's HR, I first felt a great loss
which turned to anger when I realized that I had just sent in a three year
renewal. The thought that any of my hard-earned (or even not so hard-earned)

money would go to a subscription to CQ riled me. The numerous times I have read CQ have convinced me that the magazine is tailored for contesters and appliance operators. While I have no complaint with people who get their kicks out of contesting, it is not for me (except maybe Field Day). The technical content of CQ is about the worst of any ham radio publication I have ever seen. It is certainly not for my tastes!

I decided to call the subscription office of Ham Radio and see if my renewal could be cancelled. I spoke with a very nice lady whose name I do not remember. She said that I could certainly cancel my subscription and get a refund. When I told her my subscription number, she remarked that I had been reading Ham Radio for a long time - since early 1971. I said yes, and that I was sorry to see it go - especially to CQ. She remarked that I was not alone and that a very large number of other hams were doing as I had done: cancelling their subscription immediately and asking for a refund. It was rather sad talking to this lady, who obviously was not happy with the events either. She said the decision was purely a financial one on the part of their owner, even though a number of the staff felt that CQ was the wrong magazine to sell to. Ham Radio realized that their audience was a specialized one leaning heavily toward technical topics and that CQ was just the opposite.

Well, I received a CQ magazine the other day and the mailing label indicated that I had three years and a few months of subscription left. Perhaps they have not had time to cancel it yet, or perhaps my cancellation got lost in the shuffle. In any event, I will call them in a few days to see what happened. I certainly expect that all of my renewal fee should be refunded.

In any event, if enough former Ham Radio subscribers cancel what is left of their subscription to CQ, it should deliver a quite powerful message: the amateur radio community still supports a technically oriented magazine and that CQ is inadequate. Perhaps CQ will come around and greatly improve their technical content. If they make enough of an improvement, I'll subscribe. In the mean time, I renewed my membership in the Applied Computational Electromagnetics Society, and I am looking into some of the European amateur radio journals. Perhaps others on the net can make suggestions about some of the smaller technical newsletters on VHF/UHF/microwaves. I am open to all suggestions. For those of you who are eligible for a free subscription, RF Design is an EXCELLENT magazine.

BTW, when I sent in my renewal to Ham Radio in April, I asked for an author's guide so I could submit an article. As far as submitting it to CQ, no thanks! Unfortunately it is a fact of life that when an advanced construction article is published in a magazine like CQ, a large number of people may attempt the project who really have no business doing so. The poor author gets stuck with a number of irate letters and lots of dumb questions. Well, technical questions are good and I enjoy answering them - but I don't have the time for such things as: "I substituted a Radio Shack 2N2222 for the GaAs FET and I used masking tape instead of PTFE. I used 1 microfarad mylars from my old speaker crossovers instead of the tantalum electrolytics. Why doesn't it work like you said on page 23? I know I followed your article exactly, and I have lots of experience. Why I built that 10 minute ID timer last year from the pre-etched circuit board with all the parts from my local Radio Shack!" And he doesn't even send a SASE....

I do not mean to sound elitist, but unless the technical competance of the average reader is at least somewhat near that of the audience the author intended, the highly technical article is a waste. Don't get me wrong, though. I am very much in favor of improving the technical know-how of hams. It is just that I would have to write on a far less technical level if I were trying to tailor an article for the average CQ reader. Someone has suggested that the way to improve CQ is to flood them with good technical articles. Perhaps. I hope so. But I doubt if CQ will risk losing its far larger circulation of DXers and contesters by running many highly technical articles in place of contest announcements and product "reviews" of faithful advertizers.

And before the DXers and contesters complain, let me again say that you deserve your own specialized magazine. These activities are just not for me, and I don't want to pay for a magazine that does not fit my interests.

Well, tomorrow is Field Day and I have to get the rigs ready for the mountain top! The motorcycle battery is charging and Murphy is warming up! 73

I would tend to agree with you. My consolation prize of CQ magizine came
in the mail this week. Sorry, I am an experimenter, not a appliance
operator. CQ just does not cut it!

I wonder if QEX from the ARRL is any good as an experimentation magazine?
Someone has to come out with a new HR! Someone has to!

Here is a list of the wireless electronics books that I would like to sell:

1. Modern Views of Electricity
   Oliver Lodge

` 2. Talks About Radio
   Oliver Lodge

3. Conqueror of Space
   Biography of Lee De Forest

4. Man of High Fidelity, Edwin Armstrong
   Biography

5. Loki, The Life of Steinmetz
   Biography

6. From Immigrant to Inventor, Pupin
   Biography

7. Radio Telephony,
   Goldsmith, 1918

8. Elements of Electricity.
   Millikan, 1919 $100

9. Experimental Electrical Engineering
   Karapetoff, 1909, First Edition $100

10. Principales Underlying Radio Communications
    U. S. Army Signal Corps, 1921

11. Hjemmets Radio, Norwegian, 1934

12. Standard Handbook for Electrical Engineeres
    1915, 1983 pages

13. Radio for Everybody, 1922

14. ICS Handbook for Electrical Engineeres, 1908

15. Radio Laboratory Handbook, British

16. Hawkins Electrical Guide,
    Ten Volumes, 1917

RADIOS:

1. Atwater Kent Model 10 "Radiodyne" breadboard. Rare model fully operational with 120V power supply, tubes, owner's manual, and Model M horn speaker. $1,000.00

2. Western Coil Model WC19 "Radiodyne" mint conditon and working. $200.00

3. R C A Radiola III and Balanced Amplifier with tubes. $200.00

4. Priess "Stright Eight" with loop antenna. $185.00

5. Grebe "Synchrophase" excelent condition. $195.00

6. Philco Model 90 "cathedral" $495.00

7. Kennedy Model 20 Type 440 with tubes. $175.00

SPEAKERS:

1. Burns curved "petal" horn speaker, sounds great. $250.00

2. Western Electric Model 540-AW paper cone, works. 60.00

3. Bristol Baby Grand hard rubber horn speaker. $55.00

4. Atwater Kent Model "R", rare. $80.00

5. Sonochord paper cone with cloth front, mint, nice. $80.00

6. Music Master wooden horn speaker, nice. $130.00

7. Small Magnavox metal horn speaker, works. $65.00

MISC.

1. F. B. Myers RAC3 "Audion" new in box. $125.00

2. '99's, 01A's,... $10.00 - $25.00

3. Rider Manual I-V Abridged $35.00

4. Rider Manual II $30.00

5. Books ... Fine historical colletcion. Offers accepted.

Unfortunately, I never really knew about Ham Radio magazine. I have some old issues (early late 70's, early 80's) but just assumed they weren't around anymore. Maybe it's a good thing, because I'm not in mourning over it. I am sad to see a quality publication go, though. I am an experimenter, too, just starting in RF projects.

I just finished the crossband repeater mod on my TM-701A dual-band mobile rig. After running several tests I discovered that the repeated audio is extremely low. Has anyone else seen this problem? The circuitry in the TM-721/731 should be the same.....

Any help would be appreciated....

**** UoSAT-OSCAR-11 BULLETIN - 217   08 June 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** UoSAT-OSCAR-14 **

A new version of the PCE Housekeeping Integration Task (HIT) has been uploaded to the spycecraft. In addition to providing telemetry and file broadcast, this version also incorporates digipeating. The digipeat callsign is UOSAT3 (SSID 0). All binary data (e.g. telemetry & broadcast packets) will now be sent from UOSAT3-11 to allow filtering with the LCALLS command.

** CPE DETECTS SOLAR FLARE **

The Cosmic Particle Experiment (CPE) on UO-14 has been monitoring the LEO radiation environment since late April. On Mondqy 21st May, at just before Midnight, the CPE picked up enhanced activity at high latitudes, in which the particle count rate grew by two orders magnitude, peaking after about 8 hours - indicating that a solar flare had occurred. There was then a slow decay until about 22:00 hours on Thursday 24th, when there was a very sudden increase in auroral region activity - again about two orders of magnitude. This activity decreased rather more slowly, with further enhancements occurring on the evening of the 26th May and the morning of the 28th. Since then, the activity has decreased, reaching its 'normal' level by 1st June. Data from this experiment are collected and analysed at UoSAT Mission Control before being passed on to RAE Farnborough.

** 5th AMSAT-UK/UoSAT Colloquium **

The 5th AMSAT-UK/UoSAT Colloquium is taking place at the University of Surrey, England from July 26th - 29th 1990. As usual, there will be a varied programme of lectures for both the beginner and the experienced operator. Booking forms must be returned by 1st July 1990. Further details are available from Ron Broadbent, G3AAJ at AMSAT-UK.

** AO-13 **

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130 (Mode S Beacon only)
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

The best estimate of the current attitude is:

BLON = 179 and BLAT = -2.1 for 04 Jun 90

Cross mode B and S QSOs are possible during MA 135 to 140.

** AO-10 **

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

** BID **

Please use BID $UOSAT.217 when copying to the packet network.

In article <164@bongo.UUCP>, julian@bongo.UUCP (Julian Macassey) writes:

> Now my beef is that the ARRL is not pushing the science angle to the public. The constituency of the ARRL is HF Contesting. Don't believe me? Read QST. Then see who the elected officers are, certainly in my neck of the woods, they are all DXCC (No AT&T endorsement) types.

Maybe that's because the experimenter/scientist types consider themselves above mere "politics." Hey, the voters can't vote for a person who isn't a candidate. As long as the technical types stay out of the political arena, they will be poorly represented. This is as true of the ARRL Board of Directors as it is of any other political body.

> Remember what happened to the Microwave column in QST? What happened to QEX? Then Ham Radio Mag just died. CQ Mag the home of "How I worked the contest from the Djibouti Hilton" type articles is doing fine. When the contesters finally die what are we going to do?

Ummm... what specifically are you referring to with QEX? I can tell you that the biggest problem with QEX is that people don't submit good material for it. On numerous occasions, the editors have suggested that a piece submitted for QST go into QEX, only to have the author leave in a snit. The reality is that the technical level of QST is going to approach (hopefully from above) the technical level of the _average_ ham, not the techie. (That's one reason why Ham Radio was successful for so many years--little competition in its niche market.) If people want to get highly technical information published by ARRL, QEX and the conference proceedings are the only available forums. (BTW, the technical editors probably wouldn't agree with that statement, but I think they would agree that a "simple but engaging" project has a better chance of appearing in QST than a highly technical one.)

> Today I called the ARRL to see if they had any Public Service Announcement (PSA) Videos. A PSA is really a free ad that stations run as filler, they sometimes make it on the air early Sunday morning. I was told they had one with Ronnie Milsap. I will have it in a week or two and see what it is like. How about a video of a group of guys at consoles at JPL or somewhere saying that they started life wondering about ham radio and now they steer spacecraft across the heavens. How about an airline pilot on a flight deck saying that he learned about

> foreign countries, weather and radio communications as a ham and the
> wonder of it all made him want to do it for a living so now he's a
> pilot. We must all know people who have prestigious careers because
> they became interested in amateur radio. Can't that too often about
> bowling.

A wonderful idea. It's worth suggesting directly to the folks in the Educational Activities Department at HQ. Write to Rosalie White. (They are getting some spots done by the ham astronauts, but I don't know the content.)

Understand, though, that resources--especially time--are hard to come by at ARRL HQ. The EAD has three people in it. Two of them work full time getting requested material out to the preople/clubs requesting it; the other one (Rosalie) has to do everything else, which includes planning the Educational conference, coordinating the SAREX missions, coordinating the generation and publication of lesson plans, etc. So don't expect that they can initiate a large-scale program and carry it through. What works best is when volunteers do more than just come up with good ideas. If you can locate someone capable of producing the spots, locate the people to appear in them, get scripts written, shoot the spots, title them, and deliver them to ARRL HQ, maybe they'll get distributed, but it would be better to locate someone to take care of distribution too. It's not that we don't care, it's that we don't have the time and the money to do all of the good things that you (and we) would like us to do. I don't remember the exact numbers, but in the last ten years the number of staff has stayed nearly constant while the membership has increased by something like 40%. (That's probably not the right number, but the point is the number has increased a lot.) So things are operating about full-out at HQ.

>   Let's interest people in the science of it all. If you just like to
> yak, you can bowl. If you like to be rude and obnoxious, rather than
> contesting, you could sell encyclopedias door to door. If we get

Part of the problem we have now is the "I'm OK, you're not" attitude reflected by comments like those. Ham radio has a lot of facets, and bickering between the proponents of one thing or the other is not helpful to anyone.

>Maybe that's because the experimenter/scientist types consider themselves
>above mere "politics."

Actually, that statement reflects that

1) the speaker isn't an experimenter/scientist type
2) he doesn't understand the experimenter/scientist type
3) he considers himself a politician
4) he thinks that e/s types think they're superior
5) political types think they're superior
6) he like you to think the same

a lot of baggage to pack into one sentence. But let me provide an alternative view:

I've been in ham radio politics - I'm not well suited for it. It's not very different [from my perspective] from ordinary politics - you'd expect that. But it's very different from the world that the experimenter/scientist works in every day.

To an experimenter (or even more so, a scientist), the world is a rational place, where there are rules which strictly determine the effect from the causes. Often these are simple rules, linear, predictable, comfortable. Sometimes they are complex, as are the non-linearities of the chaoticists.

But it is a comfortable rational world, where all you have to do to make it work for you is learn the rules and extrapolate them to cover your situation or experiment. Never do rules work against their own nature, or out of spite, or for hidden reasons or to further covert agenda. And the scientist likes this comfortable rational world, where all pull together to further the one cause of knowing and doing more. In science, those who don't reason scientifically don't last long.

The political world isn't like that. Oh, it has its rules, but they are not linear, nor predictively chaotic. They are, in the main, based on estimating the worst possible motives of all concerned and the irrationalities of the common man, coupled with the need to attain and maintain power and control. In a sort of Darwinism, the political world breeds that type of person - those who cannot control do not last.

This is regrettably necessary, as people will not be governed by rational men, for the people themselves are not rational. They will not stand for strict rational control. Indeed, out of the desire for rational control grew some of the worst dictatorships of history, better only than those governed by madmen.

So the scientist (or experimenter) is not well suited to politics.

So don't ask the scientist to play politics, and don't ask the politicians to play science.

Their minds are of different bents and do not easily change.

Instead, they have to work together to determine what is best balanced agains what is really achievable.

There must be some way to help this happen in the ARRL and the rest of
amateur radio. I don't think we've been very successful so far.

- Brian

]I would tend to agree with you. My consolation prize of CQ magizine came
]in the mail this week. Sorry, I am an experimenter, not a appliance
]operator. CQ just does not cut it!
]
Yeah... me too. I think I'll wait a couple of months to see if they
start running interesting stuff before I cancel my subscription.

]I wonder if QEX from the ARRL is any good as an experimentation magazine?
QEX is a fine magazine. Unfortunately it is quite small... only a couple
of articles (plus some columns) per issue. One nice thing about QEX
is occasionally they have articles that are essentially calls for discussion
on various issues. If you don't get QEX, I recommend it.

I think I have pointed this out before, but this thread reminds me again... I have a friend who worked on computerizing the UPI wire service in the early to mid 70's (used RCA's Spectra-70 IBM 370 clones). He told me that before this incident the Cheyanne Mountain Norad complex was hard wired into the distribution network for the UPI and AP broadcast wires so that any time they sent characters down the wire from their end it would automatically disconnect the New York national feed or local feeds from state offices and run the Norad message. No editor at AP or UPI got to review the message, control of the wire was completely in the hands of the Norad operator's Teletype as soon as he started a (paper) tape rolling.

After the incident they disconnected all of that magic and of the late 70's (much could have changed since then of course) all the Norad message did was interrupt the editors in New York who could then decide to run it on the wire.

One scary thing about the way they computerized the UPI was that all wires for everywhere went through the main computer complex (initially in New York City, since moved to Texas (Dallas ?)). If the main complex went out there would be no UPI anywhere. The AP took a more conservative approach and had local computer equipment in each state office that could at least originate local news feeds and network to the other local offices if the national (New York) wire control points died.

I haven't kept up with the wire service's current configurations since the revolution in computing power on a desktop and the more recent revolution in wideband digital communications via fiber. I know that the UPI and AP both used satellite systems in the 1980's to distribute news to end users (radio stations and newspapers) and to their offices, but whether they still do, and how they currently handle the control of their national streams of news is unclear to me. In the 70's most news was distributed either by a FDM multiplexed 120 hz channel spaced low speed FSK system carrying 5 level Baudot (used for all the radio and TV wires) and 6 level TTS (teletypesetter used for newspaper wires) or by 1200 baud ASCII (carried everything). Both were sent to the clients over leased private line voice grade data circuits. What is currently used I don't know, but with modern modems and micro's much more than just one stream of 1200 baud could be sent over a voice grade line, and of course a VSAT terminal can handle tens to hundreds of kbps over a two or three foot dish. (If anybody out there knows how things are now set up I'd be curious to hear).

  Sb: Icom 02 and 04 Audio Fix

  ===== AUDIO MODIFICATION FOR ICOM IC02 AND IC04 RADIOS =====
  ------------------------------------------------------------------------------
```

This audio mod works on the 02 and 04AT. It increases the level of audio, as well as rolling off some of the lows. Sounds real nice. It involves the circuit around Q105.

1. Replace C119 with a .01 uF cap (disc ceramic is fine).

2. Parallel R131 with a 1 uF cap (use a tantalum cap).

3. Parallel R132 with a .01 uF cap (disc ceramic is fine).

This is not the same mod as the one International Radio is advertising, which involves changing C117.

I tried an AB-1 Audio Blaster from Engineering Consulting, and was very unhappy with the results. I am very pleased with the audio given by this mod (much cheaper too!).

Note: I haven't tried or verified this, proceed at your own risk. WA2ISE

I'll ignore the insults and simply remark that you infer considerably more than I implied. I _do_ think that a lot of s/e types consider themselves above politics. But then, so do the members of most every group--except politicians.

[much deleted]
> So the scientist (or experimenter) is not well suited to politics.

Gee, that doesn't say much for their adaptability, does it?

I don't accept that there is some irreversible dichotomy between the so-called "scientific" mind and the "political" one. Such a characterization is incredibly simplistic. It also runs counter to my experience (I do have some, in spite of what you assume). I do agree that all players must be involved in devising solutions to problems, which is all I was suggesting in the first place, one of the more effective ways of getting involved being to run for office.

> There must be some way to help this happen in the ARRL and the rest of
> amateur radio. I don't think we've been very successful so far.

No, and if the prevailing attitude is one of "leave politics to the politicians" we aren't likely to be.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

I also regret the passing of Ham Radio Magazine. For general electronics coverage, I have been reading Electronics & Wireless World published in England. Their tutorials on electromagnetics have been excellent. Is there a comparable magazine that specializes in Ham Radio?

Having used a SONY ICF-2010 for several years, I'm now ready to
"upgrade" my SWL equipment.  Keeping finances in mind, I've
narrowed my selection down to two receivers -- the ICOM R71A and
the Kenwood R5000.

My question is, which of these two receivers would give me more
"bang for the buck?"  The price is the same for both receivers, so
what's the difference between the two (if any)?

Any comments on either of these receivers by those who've had the
chance to own or operate one would be greatly appreciated.  I'd
just hate to slap myself in the forehead later on down the road and
say, "Wow, I could have had a [fill-in-the-blank]!"

I've got a 731, and the crossband-repeat level is fine on my radio.
Are you unplugging the local microphone when you use the
crossband-repeat mode?  That might lower the level some.

Jim, I would be interested in getting information on the electronics magazine that you were referring to in you post. Thanks.

>> I also regret the passing of Ham Radio Magazine. For general electronics coverage, I have been reading Electronics & Wireless World published in England. Their tutorials on electromagnetics have been excellent.
>
>Jim, I would be interested in getting information on the electronics magazine that you were referring to in you post. Thanks.

Perhaps I should also help plug WW, having read it since the early 60s when it was known simply as Wireless World. Back then, it was a little different. How can I describe it -- it's like WW is to Popular Electronics as HR is to CQ :-) :-). There were lots of interesting articles that you seldom find anywhere else, e.g., class D amplifiers. These were not construction articles as you see them in other magazines but simply schematics and descriptions of how they work. I loved them as a high school kid.

Between then and now, Wireless World merged with, I think, Electronics (or some such) and is now called "Electronics World and Wireless World." What you have now is a mixture of the old and what reminds you of McGraw Hill's "Electronics." Quite often, there will be some articles of interest (Cross Field Antennas??) to Hams. And sometimes there are articles of interests to audio tinkerers (preamps and amps and the like). Letters to the Editor are truly, umm, how should I say it ... entertaining? (Maybe it is just very "Brit." :-) All sorts of flames regarding CFAs, cold fusion, alternate "theories" (translation: wild ideas that will *never* pass peer review :-) on Relativity, Ether, Shannon's theory and so on. What some people might call pseudo-science.

In the Silicon Gulch, you can usually pick up WW at bookstores such as "Printers, Inc" and "Tower Books." But, hey, this part of W6-land is weird. I don't expect normal bookstores in sane communities to carry it.

This is the info I can find in its pages: subscription rates in the US is stated as $116, airmail, to Reed Business Publishing, 205 E. 42nd Street, NY 10117. The rate seems high, since the single issues go for $5.95 around here and #1.95 (substitute appropriate "pound" sign if necessary) in the UK.

In article <164@bongo.UUCP> julian@bongo.UUCP (Julian Macassey) writes:
> Today you can
>work 100 countries in an afternoon with the AT&T endorsement - Your
>itemised phone bill is confirmation. So people are no longer amazed
>that you can tell someone in Africa that they are "Fahvnahncuessell?"

I keep hearing this, but I don't believe it. I've talked to people
who do ham demos for kids, and the kids are enthralled with being
able to hear someone in Minnesota, ferevvins sake--all the more so
for countries outside the U.S.

In order to call 100 countries, you either have to know someone there
or be willing to waste a lot of money on dialing random numbers. Either
way, where's the adventure? I believe it *is* still exciting to dial
around a band, not knowing who you'll find.

Last year I dialed past the local 440 MHz repeater that has a 10m link
and heard a Californian, a Mexican, and an Australian chatting away.
All this on a radio that I can hold in my hand! *I* was sure impressed.

Does everyone get reactions from non-hams (or even from hams) like
Julian describes? Or are people less blase' than he thinks?

> I have been told that in US schools Geography is no longer a
>subject. Fancy going for DXCC and not knowing where the countries
>really are.

Yeah, well, listen to a DX club repeater sometime and it probably
won't cheer you up in this regard. I've been appalled at the lack
of knowledge of (1) geography, (2) callsign prefixes, (3) languages, etc.
by the so-called hotshot DXers.

>   Today I called the ARRL to see if they had any Public Service

>Announcement (PSA) Videos.

I have some print ads for amateur radio that I roughed out a couple of years ago. One is aimed at computer magazines. Some of you won't like it, though, because it starts by suggesting a code key as a relaxing low-tech pastime for a computerist's off-hours. :-) It goes on, of course, to talk about using computers to decode CW, and about packet radio, satellites, etc. etc.

Ad campaigns don't come cheap, though. Anyone want to pony up the money so the League can run stuff like this in the major computer mags on a consistent basis??

As for Julian's suggestion about having PSAs in which people talk about how ham radio led them to their careers, that's a great idea. But we don't need to wait until we find a film crew to film PSAs: that's a great idea for a feature article in a local newspaper or a professional magazine.

You don't need to write it yourself--have your local ham radio PR person contact the business or feature desk at the local paper and tell them about 2-3 well-known people in your area who are hams. (And who have already agreed to be interviewed.) Contact the editor of magazines in those people's professions and give them the same lead. I'm working on just such a project in this area and have a nibble from the business editor of one of the major Bay Area papers. As valuable a resource as Newington is, we don't need to wait for them to do everything for us.

Patty

SpaceNews

MONDAY JUNE 25, 1990

SpaceNews is published and distributed weekly around the world on USENET and Amateur Packet Radio. It is available for unlimited distribution.

* SHUTTLE NEWS *

The crew for mission STS-38 arrived at the Kennedy Space Center last week for the Terminal Countdown Demonstration Test. Atlantis was rolled out to launch pad 39-A last week. The hot firing test of the orbiter's two APUs (Auxiliary Power Units) went well. The APUs were run for seven minutes each at normal speed and for ten seconds at high speed. The launch date for this mission will be announced this week.

* OSCAR-12 LIVES AGAIN *

Fuji-OSCAR-12 has been heard on recent occasions by G3IOR, G3CAG and G4CUO. The spacecraft is apparently receiving enough sunlight to produce a weak battery charging current and support low-power transponder and beacon operations. FO-12 was switched off by telecommand last year, but apparently switched back on when it received commands sent to its sucessor, FO-20. FO-12 transponder and beacon activity cease when it receives strong uplink signals intended for FO-20.

* CRRES LAUNCH *

CRRES, to be launched aboard an Atlas Centaur Rocket on July 9th, will embark on a joint NASA/USAF mission to study the Earth's magnetic field and the effects of the radiation environment of space on advanced electronics. Chemical releases from the satellite in the ionosphere and magnetosphere will briefly "paint" the waves and lines of magnetic fields with luminous particles. During the mission's first year, canisters of five chemical tracers expelled from the spacecraft will create brilliantly visible releases over the Carribean, South Pacific, and North America.

* CQ DX *

If there are any Amateur Radio operators outside of North America who have both UUCP and Amateur Packet radio availability and would like to help distributing SpaceNews through existing packet networks, please send me a note so we can establish a distribution network. I can place interested stations on a UUCP mailing list so they will be able to forward SpaceNews to their local packet systems and help reduce the long delay many foreign stations are reporting before receiving SpaceNews.

* FEEDBACK WELCOMED *
=====================
Feedback regarding SpaceNews can be directed to the editor (John) via any of the following paths:

It seems like a lot of money to me to tie up in a controller.

> I would expect that the controller would offer all the features of
> the ACC line plus things like:

Well, these things are about as expensive (and in my opinion, not worth it due to lack of the features I want).

> Has anyone built the necessary interface hardware? I'd be more likely
> to program such a thing if I didn't have to build the hardware.

It would be nice to have all the functionality of a controller for a repeater on a single board you can plug into a PC. I had asked about the interface between controllers and the actual repeaters some while back here on rec.ham-radio, and the general concensus I got was that there is not standard interface bewteen the repeater hardware and the controller. I don't know what assumptions, or excess hardware for all the variations, controllers like the ACC ones have.

I would consider the following connections to be essential:

Controller ---> Repeater
1. On/Off (PTT) the transmitter.
2. On/Off the audio.
3. On/Off the transmit CTCSS.
4. Audio from CPU for ID, battery mode indicator, etc.

Repeater ---> Controller
1. Carrier level
2. Discriminator noise level
3. Discriminator output
4. Audio

Other ---> Controller
1. Battery voltage
2. Battery current
3. PA voltage
4. PA current
5. SWR
6. Tower lights current
7. Clock/Time

Whether or not things like CTCSS decoder/encoder, DTMF decoder/encoder, squelch level, etc., should be in the "radio" or on the controller are probably religious issues. I personally want CPU control over these things so I can do everything from setting them remotely to programming them to dynamically change to meet conditions. For instance, I would want different squelch levels in effect for "idle" and "ready" states (idle is when the repeater has not been transmitting lately; ready is between transmissions of an active QSO) so that it requires a good signal to bring up the machine, but it will tolerate some fading during the QSO. Likewise a different set of squelch levels would be required if CTCSS is present (to allow locals to access w/o CTCSS, but DX needs CTCSS). Another possibility is to allow users to turn off the need for CTCSS on a per-QSO basis (it comes back on when the machine goes to idle state). Perhaps CTCSS could be required to bring up the machine, and not needed once it is up. I could put all these things in a huge matrix and plug in LOTS of values to program the machine with, and I know that ACC controllers cannot do this.

Cross-band and multi-band repeaters need even more sophisticated control, especially when multiple receivers are concurrently receiving different but good signals; what do you want your repeater to do?

I, too, prefer to program the software (and I mean writing machine/assembly code, not CONFIGURING as you would do to an ACC even though they CALL that "programming") instead of building the hardware. However, building a controller from a PC compatible mother board, or perhaps (depending on just how easily boards can be added) Kantronics new DataEngine, seems like a reasonable way to get the hardware in place ready for programming. Having a hard disk is not essential, but does give you some flexibility. You could, if you are careful, upload new controller code via radio.

ARRL LETTER - VOLUME 9 - NUMBER 12 - June 15, 1990 - Page 1 of 4

GAY E. MILIUS, W4UG, SK

ARRL Director Emeritus Gay E. Milius Jr., W4UG, of Virginia Beach, VA, died June 6 after a long illness. He was 79, and the husband of Martha Milius.

Milius was vice director of the ARRL Hudson Division in 1951 and 1952, and vice director of the Roanoke Division from 1977 to 1980. He became Roanoke Division director in 1980 and held that post until 1989.

An active DXer and DXCC Honor Roll member, he was the Roanoke Division's representative to the ARRL DX Advisory Committee at the time of his death.

He was a 1933 graduate of Dartmouth College and a 1941 graduate of Fordham Law School. He was a retired commander in the US Naval Reserve and a veteran of the Second World War and of the Korean War.

Besides his wife, he leaves two daughters, Carroll Huffman of Twin Lakes, MN and Mitzi Milius of Aspen, CO; a son, Gay E. Milius III of New York City; and a brother, Howard Milius of Cranford, NJ.

The funeral and burial were June 11 in Virginia Beach.

The family requests that memorial donations be made to the American Radio Relay League.

TRANSCONTINENTAL RELAY AIDS YOUNG SOVIET AMATEUR

American amateurs from coast to coast, using HF as well as VHF FM and packet, have come to the aid of a critically injured Russian amateur.

On May 25 a group of Soviet hams, from the UZ4FWO club station in Penza, were involved in an automobile accident enroute to a radiosport event. RA4FB, Oleg Kolosilin, was killed. Oleg Porugov, UA4FAY, was seriously injured.

Porugov, 25, lies in a coma in a hospital near Ryazan, about 150 miles from Moscow. He suffers from pneumonia and one lung has collapsed. Hiscondition prevents doctors from moving him to better facilities.

Porugov's attending physician, a Dr. Makarov, has stated "In small Soviet towns the doctors can be good, but medical supplies--even disposable syringes--are scarce."

In daily contact with Makarov is an American neurosurgeon, Dr. Joseph Izzo of Foster City, Calif. Izzo responds to Telex and E-mail messages from Makarov, answering questions by Amateur Radio. The responses, carried on a daily schedule, are between the stations of Len Traubman, W6HJK, a dentist in San Mateo, and UZ4FWO, in Soviet Russia. Help with relaying and translation has been provided by Ed Kritsky, NT2X, and Angel Garcia, WA2VUY.

Kritsky, who came to the United States from Leningrad in 1978, took a telephone call shortly after the accident from another American amateur. "UZ4FWO needs to talk to you, Ed. They need medical consultation."

Kritsky asked Igor, the UZ4FWO operator, if he had any American ham acquaintances in the medical profession. Igor suggested Traubman and Dr. Lawrence M. Probes, ND8S, who also has acted as a relay station. Meanwhile, Kritsky also had contacted a local physician, Dr. Anatoly Barkan of Brooklyn, another Soviet emigre.

Igor passed the condition of the patient to Kritsky via Amateur Radio, and Kritsky sent it by facsimile to Traubman and Dr. Izzo (who although not a ham, paid for the initial shipment of drugs).

In addition to medical advice, several hundred dollars worth of supplies for Porugov, including powerful antibiotics and special tracheal tubing, have been arranged for and shipped from the United States. Charles L. Starke, NX2T, a medical internist, arranged for the tubing, which was shuttled to JFK airport by Alan Singer, N2KW.

Singer located Starke using the Tri-State DX PaketCluster Network.

Thanks to Amateur Radio, Soviet amateurs have been able to receive word that the shipments are enroute, allowing them to get to tche Moscow airport in time to arrange for expeditious treatment by customs authorities. One of the UZ4FWO operators has been standing by in Moscow to receive the shipments.

Kritsky observed that initially the chief of medicine in Ryazan was skeptical of these arrangements, of taking advice from outsiders. "But once he heard the tone of voice of those talking on 20 meters," Kritsky said, "he knew we were there to help. He knew we cared."

"We are just a few American hams doing what we can," said WA2VUY. "If Igor were not a ham, none of this probably could have happened," he said.

On Monday, June 11, 17 days after the accident, Oleg Porugov, UA4FAY, opened his eyes for the first time, and moved his hand.

MORE HAMS IN SPACE

Three more astronauts soon will have Amateur Radio call signs, joining Ken Cameron, KB5AWP, aboard STS-37 (a SAREX mission) in November. Flight commander Steve Nagel and mission specialists Linda Godwin and Jay Apt all have recently passed Technician class exams. Godwin and Nagel took their exams in Dallas at the Ham Con on June 9, where Cameron upgraded to General class. Nagel passed his test in May.

The fifth STS-37 crewmember, Jerry Ross, has yet to take the plunge, but he "has some books on his desk," according to Cameron.

Space Shuttle STS-35, also a SAREX flight by astronaut Ron Parise, WA4SIR, was postponed again May 29 and has been returned to its hangar for major repairs. Since another Shuttle, carrying a military payload, is scheduled for launch soon, STS-35 has been pushed back to at least August.

KANSAS CITY HOSTS NATIONAL CONVENTION

More than 5000 radio amateurs attended the 1990 ARRL National Convention June 9 and 10 in Kansas City, MO. The convention, sponsored by the PhD Amateur Radio Association, featured forums on many areas of interest to amateurs, as well as a very strong turnout by manufacturers and retailers of Amateur Radio gear.

Banquet speaker Dave Bell, W6AQ, entertained some 350 guests with his presentation "The King and I," recounting how King Hussein, JY1, of Jordan, came to appear in the 1979 ARRL film "The World of Amateur Radio."

In addition to the *Westlink* Young Ham of the Year award given to Mary Alestra, KB2IGG (and reported earlier), Advanced Electronics Applications made their fifth Amateur Ambassador Award to James Heil, KB5AWM. The 22-year-old Heil, of Houston, was instrumental in creating the Clear Lake Amateur Radio Club, a general interest club with a special mission to recruit and train new amateurs.

Also in attendance was Ralph Haller, chief of FCC's Private Radio Bureau, who hosted an informal question and answer session attended by more than a dozen League directors and other officials.

HQ HOSTS OPEN HOUSE

On June 3 ARRL HQ and W1AW hosted several hundred visitors during the annual Open House. Coinciding each year with the Newington Amateur Radio League's hamfest, the event this year featured tours of the newly renovated W1AW, where visitors were able to operate as well as use two computers (recently donated by the Tandy Corporation) in conjunction with various logging programs and databases.

Lab supervisor Jon Bloom, KE3Z, demonstrated for visitors the League's setup for measuring transmitter spectral purity, with a commercial 2 meter FM transceiver and a Hewlett Packard spectrum analyzer. Visitors also got a peek at a 20 meter transceiver being designed by staff member Zack Lau, KH6CP, showing several stages of the development process. This rig is being designed for production and donation to amateur societies in third world countries.

DXCC BEGINS MOVE TO DATA PROCESSING

DXCC automation has begun in earnest, with final testing of software completed June 1. New applications and endorsements are entered into a mail log for tracking through the system. This log helps staff members quickly answer questions regarding the status of DXCC applications and endorsements in progress. On June 11 "backfilling" began--the process of entering past records into the computer on a priority basis. As endorsement applications are received they are backfilled to bring the applicant's record up to date;

the endorsement is then processed.

* Last week, a formal application for DXCC status was received at HQ for the Penguin Islands, a string of 13 islets off the coast of Namibia. The application, made by DK9KX, KC1AG, and ZS9A, indicates that the islands are claimed by South Africa, and propose DXCC status based on the islets' meeting the 75-mile minimum separation from S. Africa. It can be expected that the the DX Advisory Committee will require several months to deliberate on the application.

MORE ON SCANNER LAWS

ARRL has submitted to FCC reply comments supporting preemption of local and state laws regulating the use of mobile radios by licensed Radio Amateurs. In its May 31 comments, the League pointed out several comments filed in the proceeding that buttressed the League's position.

The League contends that possession by licensed amateurs of radio receivers that incidentally cover public safety frequencies should not be prohibited by local or state laws. This, the League pointed out, is supported by the Associated Public-Safety Communications Officers (APCO), "the nation's oldest and largest public safety communications organization."

Comments filed by Uniden America Corporation noted that all radio communications are interstate, and as such the state and local laws which prohibit the possession of radio receivers by licensed amateurs interfere with "instrumentalities of interstate commerce," which should not be permitted.

The League requested that "the Commission determine that statutes or local ordinances which preclude the possession of radio equipment by licensed radio amateurs merely because such equipment is capable of reception of police or other public service communications conflict with Federal communications law and policy, and are therefore void."

NOVICE TICKET COMING TO GREAT BRITAIN

Great Britain will have new Novice class licensees sometime in 1991, according to Radio Communication, the official journal of the Radio Society of Great Britain. The final draft of the Novice License was announced April 19.

Recognizing "the value of amateur radio as a training ground for careers in electronics and radio engineering," ministers of the Radiocommunications Agency approved, according to *RadCom*, the following guidelines:

A Novice Class B license, permitting operation on 50 and 430 MHz, as well as on 1.3 and 10 GHz. Passing of a 5 wpm Morse test after one year as a Novice Class B licensee will allow the licensee privileges on 1.8, 3.5, 10, 21, and 28 MHz, with 5 watts dc input. The 28 MHz privileges include radiotelephony in the 28.3 to 28.5 MHz segment.

(In Great Britain both "full" and Novice licensees are designated either "A" (including CW) or "B" (codeless).

It should be noted that after 25 years of a codeless "full" license (with full privileges above 30 MHz), Great Britain now prepares to institute a Novice license along the lines of the Novice license that has existed in the US for more than 30 years.

Training courses conducted by RSGB will be followed by a written exam for the Novice Class B license. June *RadCom* features an article on preparing to teach such classes.

* On an unrelated matter of interest from England, the April 1990 issue of RadCom reports the results of a survey of 10 "old timers" (over 50 years old). These CW operators were first asked to specify at what frequency they preferred to copy code, then were allowed to actually copy CW. The frequency of the tone they chose was measured, and averaged about 500 Hertz. Manufacturers who design transceivers should note this. "The impact on AF filter design and BFO crystal selection," RadCom says, "is obvious."

BRIEFS

* The latest issue of *WARC Countdown*, a newsletter to all IARU member societies, stresses the need to "ensure that at least one suitably qualified radio amateur is designated as a full participant in his country's WARC-92 delegation." Member societies are encouraged to, if necessary, first convince their governments of the value of Amateur Radio, then to make a ham a delegate. "It goes without saying," the newsletter says, "that the case for Amateur Radio at WARC-92 can best be made by a ham."

* ARRL Volunteer Counsel Frank Terranella, N2IGO, has announced a meeting and forum in conjunction with the ARRL Hudson Division Convention on Sunday, July 8, at the New York Institute of Technology. A one-hour meeting of all the division's VCs will be followed by a public forum, where VCs will answer questions regarding legal issues of concern to hams. For more information, contact Terranella at 201-947-4100.

*Every new ham is special, but Jack Lee is something else again. He eagerly awaits arrival of his Novice ticket after passing the exam May 30 under the watchful eyes of the Newington Amateur Radio League and the Pioneer Valley (Connecticut) Radio Association. The test, administered at W1AW, concluded a licensing class directed by N1FCK and W1VMY. By the way, Mr. Lee's full name is John Maxim Lee, and his grandfather was Hiram Percy Maxim, founder and first president of ARRL.

* FCC has denied a request to establish an Amateur Radio "license" free of any examination. The request for rule making, by Donald L. Stoner, W6TNS, was for a "digital communicator class" permit that would have allowed licensed amateurs to grant permission to up to 26 non-licensed persons to be control operators. Proposed operations would have been on the 33 cm amateur band.

In its denial, dated May 22, the Commission cited federal law precluding operators who have not demonstrated "their qualifications" to the Commisssion.

* The *RSGB Microwave Handbook Vol. 1* is the latest addition to the ARRL library. Edited by G3PFR, it covers microwave theory and practice in mostly non-mathematical language. Two additional volumes will follow. 224 pages.

* Don't forget Field Day! It's June 23 and 24 this year, and there's just time to request a Field Day package from HQ. Rules are in May *QST*, pp 84 and 85.

* The June issue of *QEX*, the ARRL Experimenters' Exchange, features a system for TNCs using NET/ROM software to prevent packet collision. This should be of special interest to operators of PacketCluster and similar networks.

* July *QST* solicits nominations for director and vice director in the following ARRL divisions: Central, Hudson, New England, Northwestern, Roanoke, Rocky Mountain, Southwestern, and West Gulf. See the July *QST* "Happenings" column for details.

Not really. My club just got its renewal notice for QEX and I have
decided not to renew it. (We are an ARRL-affiliated club, by the
way, which has some *teriffic* benefits).

My problem with QEX is redundancy. I have seen an article that says,
"Let's have fun and build a 20-meter cw portable tranceiver that works
on a 9-volt battery!" SOOOOO many times - this is the sort of thing
that belongs in the handbook, and not to pop up in QEX two or three
times a year.

That is correct. The difference between 20 watts and 1000 watts is 13 db or
about 2 S-units. A good antenna in a good QTH can make much more of a

difference. The difference between someone that the gods of propagation are smiling on and someone that they are not can be 60 db or more.

I remember on night working about 50 east european stations in a row. They said that I was the only W/K station that they could hear. This was not due to monster antennas or high power. It was mostly the dumb luck of being exactly where the opening was. Sill, it was great to be the target of a pileup for once.

P.S. My attitude to DXCC is, if I happen to work them great, if not, no big deal. I have about 125 confirmed countries. Almost all of them came back on the first or second call and QSL via the buro. After all, ham radio should be fun. If you are not having fun do something else.

The other day I received the July issue of CQ. To say that it is garbage would be the understatement of the year. Maybe if enough people write to IEEE they can publish a Transactions on Ham Radio, or something....
In any event, with the passing of Ham Radio seems to be an omen that the technical side of amateur radio may be doomed to extinction, along with flying, and any other hobby that involves active participation/learning (read: EFFORT) on the part of the individual. Could this be a reflection on American society in general ?

I have a FT101E and it has the speech processor, noise blanker, and calibrator. I think the EE version did not have the speech processor and maybe the noise blanker.

I also got my copy of CQ (instead of Ham Radio). I guess i'll let the subscription expire (October or so), but i'll not renew it. It would be nice to see a list of other magazines that are available, cost, etc. I'm afraid there is not a lot of choice. QST is ok, but there sure is a lot of contest, ARRL news, etc, etc, etc.

one of the best ways to support science education is to become INVOLVED in the science fair programs in a local school. If they don't have one start one (with the help of the local school). One has to be careful not to step on the toes of the local science teachers, principles, etc. but I've found them to be open to ideas, HELP, etc. We raised money for prizes, organized field trips, etc. It works. A ham radio display at a local science fair would be a good idea.

The previous reason for my query was that I had an excellent opportunity to buy a Yaesu FT101E, and was unsure whether it came with RF speech clipper. It turns out that the FT101E does have a factory-installed speech clipper, and the deal included a Yaesu FV101 vfo, all for the price of $499 Canadian. Now if I can locate a Yaesu antenna tuner which covers 160 meters, I will be all set.

Y.N. Miles,
<MULTI@TRIUMFcl.bitnet>

ps: I replaced the 3SK40 dual-gate mosfets with Motorola 3N211 mosfets.

The majority of us shmucks are running 200 watts input and are doing just fine. I'd bet that a vote to reduce max input power on HF to 200 would pass! (if it could only be put to a vote...) Sure, some would still have amps and/or build them, but I'd also bet that *most* of the KW ops couldn't build one. Imagine how one of us 200 watters sounds to a QRPer. Same difference but a move in the right direction.

I, personally, wouldn't mind it if omnidirectional antennas were also illegal. Why should anybody expect to own a frequency in *every* direction. I'd be happy, though, to just have a lower power limit. One can do *so* much with antenna's - it's amazing.

We'd have *alot* more room on our bands if people used directional antennas and ran reduced power. The latter would force the fomer somewhat.

Perhaps we should all go back to nursery school and kindergarten and learn how to share.

What a deal - my $100 worth - for free!

This is very excellent advice and a *very* effective way to make your point to them. Much quicker than composing a letter which will get scanned at best. I'm going to cancel. If and when they want to send me free copies of a new-and-improved CQ to entice me to sub I'll scan it. Remember, money talks and bullshit walks. They *are* touting the "new" subscription numbers to advertisers. You can bet that the advertisers are watching the sub numbers.

If you have the time, you should also perhaps indicate to them what will make you subscribe. Perhaps a technical journal? Give them suggestions and alternatives if you do this.

I have some vague idea what its all about, but if there are more knowledgeable contesters on the net, please come to my aid.

The OCTOPUS is a switching network which connects a number of operating transmitters, but only allows a single transmitter to transmit at any given time. The idea is that you can have multiple band positions active at the same time, but since the octopus prevents you from putting more than one signal on the air at any given time, you can submit your log as MULTI-SINGLE rather than MULTI-MULTI. Clearly, the performance of the station using an octopus is going to be closer to MULTI-MULTI and far beyond anything you hope to achieve with the traditional MULTI-SINGLE.

I believe the octopus was first introduced by a very cleaver bunch at one of the big eastern european contest clubs. I would not view it as "illegal" but rather as a very clever innovation. Subsequent to its introduction, I believe, the rules of the CQ World Wide DX Contest were revised to exclude its use in MULTI-SINGLE.

I have not looked closely at FD rules, but perhaps they are not properly phrased to exclude the octopus? If so, be careful not to criticize the operators for "illegal" operation- they may just be more clever than the rest!

This raises an interesting question: how many big guns do you think limit themselves to 1500? I would not be surprised if there were one hundred stations running at least 10kW in the US. There will always be people who run as much as they please regardless of the rules. Not to say that they are necessarily bad ops (whatever that means :^).

[Part 1 of 2]

Magazines related to ham radio from Ulrich's International Periodicals Directory 1988-89 edition. Comments on the content or value of any of these from those who have seen them would be appreciated. I might have missed some of the foreign language ones since it didn't always give a hint as to the subject matter. Also, the US magazine "Ham Radio" was not included in their list. I don't know what the criteria was for inclusion in their listing. If you notice an omission, please send me the relevant info, so I can maintain the list. Enjoy.

    [Stuff about the audio not being great]

    You can fix this audio problem easily by building a Audio pass-through
cable.  Very simply build a cable that connects the tip of the earphone
jack to the tip of the microphone jack.  Like this:

            --------           100K ohms         ---------
      <----------------------/\/\/\/\/\/\/-------------------->
            --------                             ---------
         mini-plug                               sub-mini plug

Connect only the tips.  Do not connect the grounds.  This results in
very good audio, the level of which is controlable by the volume
control.

This isn't about the review, but I noticed at least two errors in K2EEK's editorial, "Zero Bias". First, he used J. Craig Clark's old call, N1ACH, instead of his current call, NX1G. Second, they printed the word "peaked" when the really meant "piqued". I'm starting to miss _ham radio_ already!

David Tiller talks of some mysterious and growly interference on 10M. If that is the only place you hear this, you are lucky!

I have them on all bands. They come in intervals just like yours! They seem to be about 20-30KHz wide and occur every 50-60KHz. They are EXTREMELY annoying, I agree. I just always assumed that they are from noisy power lines in the area, but have never really tried to verify this theory.

I was thrilled to see you mention this! As I read, I was amazed at how similar to my problem yours is and how well you described it.

Anyone got any ideas? I'm sure someone SOMEWHERE knows what it is! But like I said, I have a sneaky suspicion that it's power line noise.

Are there any members of the Amateur Auxiliary here? What ability does the (ahem) AA :-) have to help control this sort of crap that's going on on 20M and elsewhere? I would love to get in on such an activity. Just tuning around, I hear so much garbage and feel helpless to do anything about it, as many others have stated here.

How does the Auxiliary work? I guess I can whip out the Handbook. Hmmm... precious little. It refers to an article in QST of Aug '84.

But hey, if we all write to our section managers (the guys that control the Auxiliary for their area) and find out about this, maybe we CAN do something!

I'm not one to advocate "tattling" on a fellow ham, but if he is deliberately abusing the privilege, than screw it! Let the FCC know and hope that $1000 fine does the trick!

What do you all say? I have not heard of ANYONE being in the Aux., nor have I heard any mention of it in all my many years of hamming. (1.5, to be precise!) :-)

I really get steamed hearing it, though... and I'm ready to DO something about it, dammit!

I have made a program that can control a TS440 via the seriel command set. The program is called TSRem and runs on a IBM or compatible computer. It requires the interface IF232 from Kenwood or a self made that can concert 0/5V logic to standard RS232 +/-12V.

All seriel available functions can be controlled, and there is a menu for controlling the 100 memories. You can save or load memory files, and write a comment to every memory channel.

You can write to me at E-mail:

A recent poster complained about the quality of the "review"
of the AEA Isopole antenna in the most recent CQ. He asked
whether this is a normal review for CQ ...

Well, it is. CQ has been notorious for years regarding its so-called
equipment reviews. They are almost never more than "gee, I liked
it and it fit in my Porsche." I would never, ever, make a buying
decision based on anything I read in CQ. The only reviews with
any credibility at all are those in QST. They have the lab equipment
to evaluate gear, the smarts to conduct the tests correctly, the
wisdom to refrain from testing stuff they can't evaluate properly, and
the cojones to point out shortcomings. They aren't perfect, but they're
a long shot better than the drivel that CQ passes off as "reviews."

There.

Well, I finally got my backordered QRP Notebook today! I'm glad it went
backorder, because it's the brand-new 1990 edition!

From what I've already seen, it's a GREAT reference.

I got this plus the three QST's I missed for rejoining the ARRL last month.
That's over $10 of goodies, there... FREE!

If your membership expires... wait a little bit to renew! :-)
It's worth it!

Several people have mentioned about the Saturday in 1971 the news wire services transmitted the EBS message that said an attack on the United States had been detected. I was working on the air at WMMB in Melbourne, Florida when that message rolled down the wire.

What I remember most about that day was immediately after the message that in effect announced the start of World War III, the AP followed with the Chicago hog prices. It was hard to take the message seriously when the wire is giving more coverage to hogs than the attack.

Every radio station was susposed to have a red envelope containing the "authenticator list" for EBS tests. The authenticator list was a series of words for each day of the month. The word in the envelope must match the authenticator word on the message before you can consider the message as real. The word for that day was HATEFULNESS. The EBS message had the correct authenticator word. I had to consider the message as real and read the "red card" EBS message over the air then took the station off the air. (We were not the primary EBS station.)

It took the AP 40 minutes to properly terminate the EBS message. During that time, I remember taking many phone calls from irate listeners and very upset station manager. The station manager cooled down when the FCC investigated and found that very few broadcast stations around the country actually did what they were susposed to during the alert.

While most hams don't possess the type of equipment to make detailed measurements on review antennas you are correct to indicate that there are a few parameters which every ham could benefit knowing before rushing out to buy one of these wallet smashers.

I guess this is how CQ can manage to run several reviews of the same item (they have done it in the past). All the more reason to join ARRL and read QST, this is the type of review they will have a ball with. Several years ago QST did a review
on a broad band dipole; after running all the usual tests they even X-RAYed! the matching network and discovered several components in the potting that were not even connected!!! And they even FLAMED the product in the report. That is QUALITY
in editorial policy, it's a shame that this is being diluted by the need to mantain a broad base of readership.

So we'll all have to wait for the QST review of the AEA IsoLoop.

73,

Subject: ANS: Field day software bugs

Let me know PLEASE if you get an answer! I have the same problem and have written him email on it. Also ftp'ed the file again just to make 100% sure that it didn't get damaged in transit... unlikely but I wanted to make absolutely sure. Same thing.

I am considering calling on the phone... I have no other replacement for the program and we now are counting on it.

Last ditch effort would be to take the data files after field day and write a routine to comma delimit them, or in some other way make them readable for DBASE or one of its many cousins.

What a bummer :-(

>Just read the review of the AEA IsoLoop in the July CQ.  Being interested in
>review - but I didn't. . .)
>
  Well, for a "review" of the Iso-Loop that isn't an advertisement, check
out the May issue of WorldRadio News.  The antenna column, written
under the pseudonym "Kurt N. Sterba" contained some fairly critical
text.  I threw that issue away, unfortunately, but that column in the July
issue is interesting.  Seems that the publisher gave "Kurt" a phone
call, and demanded to know what was the deal (Apparently Mike Lamb of AEA had
given Armond a call)  Anyway, "Kurt" isn't backing down, but they did give
Lamb space for a "rebuttal", where he says just about what Gary did in his
note. (i.e. no hard numbers, the advantages of narrow bandwidth, etc.)
```

In any even, AEA has sent "Kurt" an IsoLoop to play with, and he says he will report his results in a month or two.

You know, I've never taken WorldRadio very seriously (I got a life subscription to it when I was a teenager (thanks Dad!)), But the fact that they even printed an article critical of one of their advertisers bumps up my estimation of them a notch or two. Would even the ARRL, which is a membership organization, not just a magazine, be this openly critical? Probably not. Ham radio sorely needs a Consumer Reports type of organization, to give impartial reviews, but alas, who would/could fund such a thing?

OK, OK, I'll get off my soapbox.

They're issuing faster than I would'a guessed. A friend just got N0MCR -- they whizzed through N0MA and MB in a hurry. (I wonder if they skipped a lot of the word-like calls in that range.)

Well I've only been Tech-licensed a week and a half, but one thing I do
is help people make phone calls to friends from the top of 14000'
mountains. If that doesn't stimulate interest, I dunno what will.

-- Last Sunday I had a chat with someone in Greeley from the top of
Mount Lincoln, 14286', through the Horsetooth Mountain repeater, 95.5
miles distant, using 2.5 watts on a 2m handheld with a Hot Rod antenna.

Right after that I raised someone in Colorado Springs through
line-of-sight (and what a pretty sight) to Pikes Peak, 68 miles away.

And within minutes I contacted N0UA air mobile on his way into
Centennial Airport at 8500', on simplex.

> from 140 MHz to 151 MHz...

Thanks but, as it came from the factory, it already receives on 130.0 -
174.0 (inclusive) and transmits on 140.0 - 150.0 (inclusive). (The
latter surprised me, considering the ham band is 144.0-148.0, right?)

Is there anything interesting in 150.0 - 151.0?

And how do I access the mods server? (I know, "groan", there's that
question again. Please bear with the new guy on the frequency.)

I may have seen your questions, but do not recall. If they were posed in a
manner that would require a tome to answer, I probably skipped over them -
I plead guilty. I all too often assume that dozens of others will bury you

with answers - which apparently didn't happen in this case.

If you will pose the questions once again (directly to me if you do not wish to bore the net again), I will certainly attempt to answer them to the best of my ability. Understand though, that you will obtain opinion only - based upon 25 years of professional engineering/sales/marketing/consulting and 36 years of amateur radio experience - not necessarily expert nor in total agreement with what others will tell you. Just what I think. The net result is that the advice you get is worth exactly what you pay for it -- meaning you will still have to decide for yourself after I and others share with and probably confuse moreso than enlighten you.

Just in case you didn't indicate before, it would be helpful to know the intended use(s) (SW listening, two-way communications, fixed frequency monitoring, weather satellite monitoring, RTTY, Packet, AMTOR, etc.), frequency ranges and types of modulation (AM, FM, SSB, CW, etc.) desired, whether to be used in conjunction with a transmitter now or later, portability and/or power requirements, age of the operator(s), any physical disabilities (sight, hearing ,etc.) and other pertinent requirements.

Listening is a big part of ham radio. It starts with receiving. What is it you want hear? Best regards, Wayne, KB6CSP

Your bad attitude in unpardonable. 33 years is a long time for a stupid grudge.

I think his bad attitude is especially unpardonable because he's only 27.
He is falsely attempting to don the mantle of an old-timer, when in fact
he's just a premature old fart.

I am unaware of any handhelds in the RS PRO-200x series. There are mods for
the PRO-34 handheld. The best collection of mods for the RS-200x series of
scanners, IMHO is Bill Cheek's Scanner Modification Handbook. It is available
from CRB Research Books, P.O. Box 56, Commack, NY 11725. I have no connection
with the company, but I am a satisfied customer. 73

Oops!

I didn;t think about what I was saying...

OF COURSE, EVERYONE IS GOING OUT TO FIELD DAY THIS WEEKEND.

If you go to a movie *-NEXT-* weekend, please note what you find and
let me know, if you would, via e-mail...

AS AN AFTERTHOUGHT,

maybe if the NCN folk could be convinced this was to be a nation-wide
campaign, a "quantity" discount could be arranged for smaller clubs that
could not afford the normally exorbitant rates...

I doubt if the rates are too bad as advertising rates go, it's just a lot
of money for a rubber-band & paper-clip budget...

Cheers, all!

I go to a lot of movies. Several of the local theatres (particularly those franchised under Loew's and AMC) show slides between the features. As I sat there waiting for some film to begin, it occurred to me that we could do nicely to have one or two frames in that tray to show various aspects of hamateur radio. With a local club or contact address/phone number.

I called the National Cinema Network rep who informed me of the price. It was really high--more than *-I-* could afford, but maybe a club could manage it...? ((I mean a really BIG club!))

If these folks could be cajoled into running it as a Public Service Announcement (PSA) it might be cheaper.

The main thing the rep told me was how many people, statistically, see those frames. They're only on-screen for a few seconds (Kodak Carousel on 5-sec??) but they come back around. Two or three frames in each tray would almost guarantee that each audience would see one of them.

If the slides were well done... professional media whiz needed!... it just might be worthwhile if it gets some folks aware of (1) what amateur radio is, and (2) who to contact for more information.

Comments/suggestions, anyone?

Anyone who goes to a movie this weekend, notice if your theatre does the slides (usually local adverts, coming attractions, and the ones down here in the Dallas area all have Movie Trivia questions.) Also please, try to notice who runs it, whether it's N.C.N. or someone else.

Just a thought...

73, all!

To make QSOs via the current pacsats requires more than just a TNC and radio. A 1200 baud PSK modem (kits are available from TAPR, AMSAT, and RadioKit, among others) must be constructed and interfaced with a TNC-2 or equivalent. Packcom has units already assembled that will also work. These take audio from an SSB receiver on 435 or 437 MHz pacsat frequencies and input data to the TNC. For uplinking, a 2 meter FM transmitter is used. Uplink data is "manchesterized" within the same PSK modem box, as a convenience. Satellites using this mode (known as "Mode JD, or FO-12 mode in deference to the first satellite utilizing it, the now defunct FO-12) are AO-16, LO-19 and FO-20. UO-14 uses 9600 baud packet and may also be available on FD.

If you are not already pacsat capable, getting ready in the two days remaining before set-up starts will be difficult. Of course,

analog (SSB or CW) satellite contacts will be possible via RS-10/11 (which
uses 2 meters up and 10 meters down) and/or AO-13 (which uses 435 MHz
up and 2 meters down, among other modes). If you are interested
in attempting contacts of any of these types, I can provide times
of passes for your location and frequencies of operation. Of course,
programs which provide the former and literature providing the latter

Well, I bought a used radio, a Kenwood TS 430S. It lacks
a manual. Since it is a first radio other than 2 meter handheld,
I would *really* benefit having a manual for it. So if you
have one and can make a copy, please send me e-mail, or give
me a call. I'll be happy to pay copying and postage. Might
want to contact me first in case I've alread received an offer.
(Could I be so lucky as to have multiple responses?)

A good e-mail path is uunet!sequent!dale.
Work phone is (503) 627-9842, home (503) 640-0217.
Thanks!

>>davet@tsdiag.ccur.com (Dave Tiller N2KAU)

>>his partnership's name as well, YGH aviation.) As the camera panned thru
>>his shack, I noticed several QSL cards tacked to the shelf. I could make
>>out for sure WD9ARK, and K5VNJ, and the others looked like WB8VCM and
>>WD6NJY. Anyone know these Hams in person? The calls come back to:

>>If you know these Hams, tell 'em they're celebrities since their cards
are stars in a movie!
--

WD6NJY might be WD6DJY - the Kenwood Employees' club. I heard them on the air the other day, first thought "what a mouthful of a call", then realized it rang a bell from those Kenwood ads I've seen in QST and Other Fine Mags, I guess that says something about the power oif advertising. They have that ad showing a typical ham station with about a million $ worth of gear, and some QSL cards from faraway places like Puerto Rico on the wall. Their card with this call is featured somewhere in the ad, you could try and match it up with what you saw if you can be bothered - anything rather than spending your time watching bad xenophobic movies.

Can anyone tell me the difference between a Yaesu FT101, an FT101B, and FT101E, and FT101EE, and an FT101EX. I would prefer a unit with a speech clipper and an integral 12 volt power supply as well as the 120 volt ac power supply. 600 hZ CW filter is a necessity.

We are planning a vacation to Denmark and the Netherlands this summer.

My wife and I are both licensed hams and we would like to bring our HT and or mobile transceiver with us. (ICOM-IC24AT and 3210, USA models)

We would like to use them to meet local hams, as well as for travel advice.

Are there repeaters on 2M and 440 MHz around those countries as there are here, and will our current equipment be fine for accessing them, or do they have different requirements for access, such as special tones, or different offsets?

Are the operating procedures on VHF/UHF repeaters similar to in the USA?

Can we obtain directories of repeaters, before we leave home.

What is the required procedure for reciprocal operating privileges?

Please reply via email, if possible.
Thank you very much.

Well, this message thread brings up sour memories of a meeting I was involved in planning back in March. Our club, MADRAS, invited Hugh Turnbull, W3ABC, and Kay Cragie, KC3LM, the ARRL Mid Atlantic Director/assitant Director, to speak before an open house at the Montgomery County Office building. The audience consisted of representatives of local ARRL member clubs, and we pretty well filled the cafeteria of the building. Anyhow, I was very impressed by Kay Cragie, who is the new kid on the block, and was very enthusistic about ham radio and had some very interesting ideas about expanding the hobby. However, I was very dissappointed in Hugh Turnbull, whom I voted for in the previous election. Several times during his time as the podium, questions were asked of him about what the ARRL was doing to advertize ham radio and as I worded it , "Put ham radio back on the kitchen table of America "(very patriotic, huh?). Anyhow, the answer was basically, the ARRL had no interest in doing that at all, and any elaboration was avoided by Hugh. It seems that the attitudes of the ARRL are largly one of a typical good-old-boys club, who don't want any of those new kids with unconventional ideas about the hobby get control of 'their' hobby. If this is typical of the attitudes of the ARRL, then I must agree with Wayne Greene of 73 magazine -- it's time for the ARRL to have some competition from another ham radio orgainization. Maybe than amateur radio has a chance to survive in the U.S. Unless the hobby can be made visible to the public, and be attractive to the public in todays society, it is doomed. Honestly, I don't know how to do it, but I do know it needs to be done, and soon.

Jon

In article <1990Jun19.220825.2911@midway.uchicago.edu>, gary@midway.uchicago.edu (gary buchholz) writes:

>
> Just read the review of the AEA IsoLoop in the July CQ. Being interested in purchasing one the these antennas it was the first thing I read. . . but was pretty much disappointed with the "quality" of the review. The review seemed to me to be more of an advertisement for the IsoLoop than any kind of comparative critical analysis. Further, the "performance" characteristics of the IsoLoop were given as subjective judgements when in fact a quantitative comparison could have been used.
>

I also read this artical, beacause that it was one of the first I have seen on the IsoLoop. I ended up with many of the SAME questions that GARY did.

I also noticed several other errors in the magazine, the editorial which, by the way, was the only mention of the "takeover" of Ham Radio by CQ Mag. also it made a mistake in the call sign of one of its "new" employees from Ham Radio Mag (Craig has not held N1ACH for a while now (he is now NX1G).
I don't always read the editorials..... I wonder how many devoted Ham Radio subscribers will be surprized to find a "CQ" rag in their mailbox?!?!?

Back to the review.... This same author telephoned me to get the latest copy of my DOSGATE packet application. He praised himself... kept telling of his hundreds/thousands of dedicated readers.... Basically, he wanted to perform a review of DOSGATE, and publish it in "his column".... Never having read his column, I had him send me an S.A.S.E. for the DOSGATE disk, the same offer I make to everyone else.....

A few months later.... I heard that the artical was published (this author never contacted me again... and I was not even told of the publishing date or target). I friend gave me his copy of the magazine with the artical (I think it was April, '90)... The author used over 75% of text from my documentation. There was very little 'review'.... I believe that a 'lay' person (one who is NOT familliar with DOSGATE) would not be able to figure out what DOSGATE is all about from this artical....

So I guess we should get use to these sorts of reviews... No wonder I hear so many beginers saying things like: "I talked with Italy today on 10 meters using a rubber ducky, 5 inch antenna. So it must be a good antenna". Or, (when they are listening to the output of a repeater) "Yes, your new hand held 1 watt radio is doing fine.... your signal here is 'full pin' on my S-meter"....

I guess we can only try to 'educate' the beginers... explain how to do some simple experiments, and to interpret the results.

Back to the IsoLoop (sorry for the rambling)... If anyone buys one of these things.... please let us know how it compares with a dipole cut for the band of interest, installed at a similar height, and make some contacts 'broadside' to the dipole, and switch back and forth between the two antennas while in contact with the same station.... Somehow I don't think that the IsoLoop will outperform any 'standard' antenna... It may be good as far as 'limited' space antennas go... If anyone has one, I would be glad to evaluate it for them!!

Needless to say.... I am NOT impressed with "CQ Mag".... I hope they will clean up their act.... I will probably let the rest of my subscription run its course.....

Geesh... my 'first' issue (since Ham Radio).... and I am already VERY UNHAPPY...... as 'Dire Straits' (sp?, the Rock Group) says:

I WANT MY H R M (HAM RADIO MAGAZINE)!

Rich

...
does anyone have experience with ignition noise in nissan
hardbody pickups?  i have a 1989 truck that seems to radiate lots
of ignition noise.  i'm pretty sure that the dc from the battery
is clean -- i can unhook the antenna from the radio and the noise
is eliminated.  transmit audio is clean with the engine running
-- receive is clean on very strong signals.

this occurs with a kenwood tm-201 and an icom 3210.  the hood's
```

been "bonded" with braid. the noise is spike-type ignition
noise. i don't have a problem with alternator whine.

anyway, i'm looking for opinions before i start spending money on
suppressor-type gadgetry. thanks...

I'm hoping someone in net-land can help me locate software that does
satellite link calulations. The more variables that it includes the better
I'll like it. Sources in C preferred. However, I'll try just about anything
(once :-)). We have an HP 9000/370 running HPUX. However, if it is for an
IBM PC, or Apple MacIntosh... it's still useful.

Please respond via e-mail. I'll summarize or e-mail depending on the number
of "me toos" recieved.

In response to the earlier posts on US callsign assignments, I checked the FCC ham callsign database for "X" suffix calls and found the following:

AA0X-AL9X	Ham calls AA0X-AL7X in database
AA0XA-AL9XZ	Ham calls AA4XA-AA4XZ & AA6XI & AA6XX in database
AA0XAA-AL9XZZ	No ham calls assigned in this block
K0XA-K9XZ	Ham calls K0XA thru K9XZ in database
K1XAA-K9XZZ	No ham calls assigned in this block
KA1X-KZ9X	Ham calls KA1X-KZ9X in database
KA1XA-KZ9XZ	Ham calls KA1XA-KM4XZ in database
KA1XAA-KZ9XZZ	No ham calls assigned in this block
N0XA-N9XZ	Ham calls N0XA-N9XZ in database
N0XAA-N9XZZ	No ham calls assigned in this block
NA0X-NZ9X	Ham calls NA0X-NZ9X in database
NA0XA-NZ9XZ	Ham calls NP4XA-NP4XZ in database
NA0XAA-NZ9XZZ	No ham calls assigned in this block
W0XA-W9XZ	Ham calls W0XA-W9XZ in database
W0XAA-W9XZZ	No ham calls assigned in this block
WA0X-WZ9X	Ham calls WA0X-WZ9X in database
WA0XA-WZ9XZ	No ham calls assigned in this block
WA0XAA-WZ9XZZ	No ham calls assigned in this block

The above was extracted from a fall 1989 copy of the FCC ham callsign database. X suffix ham calls have been assigned in 1x2, 2x1 and 2x2 callsign blocks. I was unable to to find any ham 1x3 or 2x3 ham calls with an "X" suffix, so these do appear to be reserved for experimental licenses. There are also no W 2x2 X suffix calls assigned yet.

```

On pretty much a $0 budget, I need to come up with a method of having a diver communicate with a (slowly) moving boat from depths ranging from about 20 to 70 feet.

In brainstorming, someone mentioned the possibility of having a very low-powered transceiver, sealed for underwater use, and using the same frequency as our video depth-finder (200 KC). This should give an on-off capability, which obviously can be used for Morse.

Anyone ever heard of such? Are we all wet? (No pun intended). Any better ideas?

All suggestions, comments, etc., gladly received. Please e-mail, as I have doubts this would be of general interest.

I am going to try not to waffle on this. It is an emotional subject. It even touches on Morris See-Dubblya.

We are faced with two items that trouble me: Ham radio is becoming an old man's game. Science is not catching the imagination of today's youth. This is not limited to the U.S., depending on whose survey you read, either the Limey's or the Yanks are getting stupider in the sciences. The only consensus seems to be that the Japanese are doing well in teaching their kids science.

I think that ham radio is applied science. Even to make a CW contact, you need to know some physics - less and less with plug 'n' play gear alas - and talking to the DX station teaches you some Geography. Hey, if you get to chat about the weather, you may learn some meteorology. Let's face it ham radio is more educational than bowling on Wednesday nights.

If we get anyone, even youth, interested in amateur radio, we are doing a small bit for the knowledge base of the world. If you learn about the piezo-electric effect, you are less likely to think that having the right crystal will give you more vivid dreams or clear up the dog's halitosis.

This forum is probably read by some of the best minds in the amateur ranks. These minds could help spread the word about amateur radio. What we should tell people is how great minds and great men enjoy amateur radio. Telling people that some overweight old farts in the local park in the last weekend in June is "Amateur Radio" is not going to fire any imaginations. Let's show them the wonder, the gee wiz stuff. We need to push the science and experimentation. Today you can work 100 countries in an afternoon with the AT&T endorsement - Your itemised phone bill is confirmation. So people are no longer amazed that you can tell someone in Africa that they are "Fahvnahncuessell?"

Tell 'em that you know how the stuff works, show 'em a globe, explain satellites, show them your computer receiving email from around the world via radio. Show them the wonder.

No doubt about it, amateur radio is one of the best applied science lessons you can give.

Now my beef is that the ARRL is not pushing the science angle to the public. The constituency of the ARRL is HF Contesting. Don't believe me? Read QST. Then see who the elected officers are, certainly in my neck of the woods, they are all DXCC (No AT&T endorsement) types. Remember what happened to the Microwave column in QST? What happened to QEX? Then Ham Radio Mag just died. CQ Mag the home of "How I worked the contest from the Djibouti Hilton" type articles is doing fine. When the contesters finally die what are we going to do?

So we have a situation where maybe if we pushed science on the public - like teaching it in schools - we could have more radio amateurs. Then if we had more amateurs, maybe there would be more interest in Science. I have been told that in US schools Geography is no longer a subject. Fancy going for DXCC and not knowing where the countries really are.

I have taught amateur radio courses and I was floored at the ignorance of my students. I had everything from housewives to a high school math teacher, an insurance salesman and even a stocks fraudster who could h do things with money that only Ivan Boesky would appreciate. My best student was a Vietnamese woman who is now an extra. She understood the wonder.

Today I called the ARRL to see if they had any Public Service Announcement (PSA) Videos. A PSA is really a free ad that stations run as filler, they sometimes make it on the air early Sunday morning. I was told they had one with Ronnie Milsap. I will have it in a week or two and see what it is like. How about a video of a group of guys at consoles at JPL or somewhere saying that they started life wondering about ham radio and now they steer spacecraft across the heavens. How about an airline pilot on a flight deck saying that he learned about foreign countries, weather and radio communications as a ham and the wonder of it all made him want to do it for a living so now he's a pilot. We must all know people who have prestigious careers because they became interested in amateur radio. Can't that too often about bowling.

I know this is long and rambling, but it is much shorter than the original. Thanks for bearing with me, I feel much better now.

Let's interest people in the science of it all. If you just like to yak, you can bowl. If you like to be rude and obnoxious, rather than contesting, you could sell encyclopedias door to door. If we get people interested in the wonder of it all, maybe the general standards will improve. They could use it.

A local ham asked that I put this idea out for comment:

With the waning of the sunspot cycle the Uniden 2510 and 2600 radios
will probably drop in price; could they be converted to operate on lower
frequence bands, yielding an affordable multimode radio? 15m & 18m?
12m & 15m?

I believe the hr2510 (pre-epoxy) can cover a 4 MHz bandwidth, so maybe
15 & 18 meter coverage is not preposterous!

I would like to try recieving Omega navigation signals on 10-15KHz
(Not sure of specific frequency). Has anyone out there built a
TRF receiver for this band? I understand the Omega signals are
pretty strong. What kind of passband filtering and gain stages
would one use...seems like 5534 op-amps should work for the gain
stages. Perhaps LC bandpass for the TRF section?

Thanks in advance,

-Charlie Thompson

I recently received my IC-2SAT and tried the LIGHT+B+#+<ON> trick. The dial now goes from 0 to something like 1309.9750. However, below 76.1 and above 355.30 the display shows a "U" where the memory channel is displayed. I assume this means some kind of error, and that the radio will only really receive between 76.1 and 355.30. Is this correct? Before I bought the set I looked at the spec sheet from ICOM. It claimed only 140 to 150 mhz recieve. However, when I went shopping the sales guy said "Yeah, the specs are usually bogus....here look for yourself...". From the factory, the 2SAT will receive 134 to 174 mhz. Also, it appeared that there was no way to quickly change the 100 and 10 mhz digit; e.g. to get from 140 to 150 mhz you had to dial in "9990" (which gives you 149.990 mhz), the turn the vfo dial to get 150 mhz. With the LIGHT+B+#+<on> you can access the 100's and 10's digit. I don't know if this "mod" is such a good idea: I like to do band scan and now the band is huge. I suppose there is a way to program skip freqs though.

No, you're thinking of "Lil Paddle", the other person who
occasionally pens the Antenna column in WRN. I'm not exactly sure
what the relationship is, if any, between the the two. They both

claim to be uh, "Old Timers", though... As you can tell, that
column is about the only one I usually read, more for its entertainment
value than anything else.

BTW, Getting back to CQ. I was pleasantly surprised to read 2 antenna
articles in the same July issue (first one for me) by Les McCoy, K1ICP,
who has been missing from QST's pages for quite some time. It's interesting
to note that he brings up the very same point about low efficiency of
small antennas.

Hi,

I have gathered from reading this newsgroup that IRC's are
used to mail QSL cards internationally. I still don't know
exactly what they are and how they should be used when QSL'ing.
Where can you get them? Which countries should you use them
for? Do you always send one along with your QSL card if you
expect the receive a reply from a station outside the U.S.
So far I have only QSL'd and received QSL's from
foreign stations using regular postage stamps.

Thanks in advance for the answers to these questions,

I guess noone heard my request for Amateur Auxiliary info...

hint hint

Seriously... is anyone on here in it? Do you think the Aux. is a tool that may assist us in our woes? WARC 92 is coming, you know! If we start now, maybe we can improve the situation and not lose as much as we probably are going to if things keep going like they are now. After all... we ARE supposed to be self-policing! So far, all I've heard of self-policing was "police men" creating more QRM telling wrong-doers that they are doing wrong! That does noone any good, and it seldom works. We need to crack down!! Does anyone even care?

actually, I'll agree that CW operators tend to be more civil, and it's about
the only mode I enjoy lately. However, communication is communication.
There is hostility on telephones, cb, the usenet, and all modes of amateur
radio. 20 meters probably just seems worse because it is such a hot band.
Everyone in the world can hear everyone else much of the time. That's a
lot of people trying to get along.

Yes, I will miss my "Ham Radio Magazine" and the outlet for part 3 of PATHFINDER.
Given the realities of publishing we may need a little more time to see the fruits
of the merger(?), Terry and Craig always quoted a minimum 4 month lead time which
could be violated only on national emergency or the like. It seems that the July
issue was pretty well buttoned up then the deal went down. Let's give them a
couple more months to demonstrate wheither the presence of Terry, Craig and the
others from HRM are going to make any difference. Another thing we could try
doing is stop talking about technical content of "CQ" and flood them with the kind
of manuscripts we would like to see. No, the day of the W2PV and K2BT type
text book is probably gone but there are other outlets for this kind of work.

Is there any one out there who would like to suggest to Craig that he push for
a quarterly technical publication under the present banner but of the quality that
we have come to expect from "Ham Radio Magazine"? They could offer it at a
discount
to "CQ" subscribers and sell it full price on the news stands and via the
bookstore.

If we are to recover our technical publications then we will have to work for them.

Interdigital filters can be built for this band and so can resonate
coils in a shielded containor (in 1988 Ham?/Antenna? Book). The
easiest is to use a set of tuned stubs or a version of the hairpin
filter. Look under microstrip or stripline filters for the lower
microwave bands. These can be cut and tuned with a knife/chissel
from regular copper clad epoxy.
  But what can I say. I have built quite a few for 1.2GHz but all
  have suffered from high 10-16db losses. If you get the notes
  from the microwave conferences from the past few years you can
  see what some people have played with (hair-pin) and get some
  references but losses will be in the 2db range.

You indeed do have a problem with the R7000.
My R7000 met it's specs in all measured frequencies
up the limits of the HP-8640B signal generator.
Calibration of the S-meter was good (linearity and
accuracy) within my ability to read the meter.
SINAD sensitivity measurements were also fine,
per the ICOM spec, and good by comparison to any
"normal" ham receiver. I will try to remember to
post a copy of my measurements. It sounds like you have
a front end problem of major proportions, which
usually means it will be simple to find. Anything which
will cause 50 dB loss in sensitivity will be a broken
wire or relay, or a transistor really evaporated by ESD,
lightning, etc. Buy a service manual for the unit, it
has complex IF switching design, which changes with
receive frequency selection.

Then look for something obvious, like a module connector
having fallen out of it's socket, etc.
Just to be safe, see what you can measure in the way of
low-level sensitivity, ie NOT S-meter readings, but
what signal strength just starts to quiet the FM receiver
noise. Bad S-meter readings may indicate S meter AMP
problems, but bad low-level sensitivity means broken
RF or IF modules.

Take heart, a problem as large as this is usually simple
to fix.

Almost everyone has a broadcast band receiver in the car. Why not use one of those broadcast band advisories like they use around amusement parks and tourist attractions? The CHP could be advised via CB channel 9, and then broadcast the information to the rest of the citizens.

Yeah, you have to go back to '58 to find a year like '89. There have been
a lot more of the really big flares (the ones that register so high that
they saturate the x-ray detectors on the satellites and the strength has to
be estimated...) this time around than in the past couple of cycles.

But there has been REAL good DX on 10 meters. Novices are making DXCC all
over the place. Stations in Germany have been taking standbys for mobiles
in rare U.S. counties and people have been coming back with 10 watts and a
trunk-mounted whip. And 50 MHz has become a real DX band, at least in the
fall and spring. I worked some rare stuff on 10 from a location I have
decided is a total RF sink (a dummy load without coax) until the pileups
got too intense.

Except for the spring of '89, which I rate a total washout here, it's been
fun hereabouts.

On the late, late, way-late movie the other night on NY channel 7 there was shown a movie starring Larry Hagman as a chivalrous helicopter pilot in Mexico. Early on in the film he was complaining to his partner that he could only talk to him via CB or Ham Radio. Interested by the mention of Ham Radio, I watched on (it was a _bad_ movie, but hey, I like _bad_ movies!). Sure enough, he started calling his buddy with real live Mexican calls (XE12L this is XE2YGH...the YGH stood for Yankee Go Home, which was his partnership's name as well, YGH aviation.) As the camera panned thru his shack, I noticed several QSL cards tacked to the shelf. I could make out for sure WD9ARK, and K5VNJ, and the others looked like WB8VCM and WD6NJY. Anyone know these Hams in person? The calls come back to:

Call-Sign: WB8VCM   Class: ADVANCED
Real Name: BRUCE M SPACER   Birthday: OCT 2, 1958
Mailing Address: 5829 TREE MOSS LN, NORTH RIDGEVILLE, OH 44039
Station Address: SAME AS MAILING ADDRESS
Valid From: MAR 10, 1987   To: MAR 10, 1997
Records Last Processed: MAR 10, 1987

Call-Sign: K5VNJ   Class: EXTRA
Previously: SAME CALL   Class: ADVANCED
Real Name: ALAN L BONNER   Birthday: JAN 5, 1947
Mailing Address: 5754 LONGVIEW ST, PAPILLION, NE 68133
Station Address: SAME AS MAILING ADDRESS
Valid From: MAR 15, 1988   To: MAR 15, 1998
Records Last Processed: MAR 15, 1988

Call-Sign: WD9ARK   Class: ADVANCED
Real Name: DALE A CARLSON   Birthday: APR 13, 1946
Mailing Address: 1411 EUNICE AVE, JOLIET, IL 60433
Station Address: SAME AS MAILING ADDRESS
Valid From: APR 7, 1987   To: APR 7, 1997
Records Last Processed: APR 7, 1987

If you know these Hams, tell 'em they're celebrities since their cards are stars in a movie!

As an avid fan of 10m, I seem to be besieged by a most annoying bit of RF interference. It occurs in my apartment, but only in certain chunks of the band. It sounds kind of growly, and appears at approximately 210KHz intervals and lasts for about 140KHz. If it helps, here are the places I measured the noise one day:

28.040 - 28.195
28.250 - 28.390
28.460 - 28.600
28.675 - 28.810
28.885 - 29.020
29.095 - 29.230

This racket is very loud, most of the time S7 or so on my meter. The higher frequency edge is very well defined, accompanied by an increase in noise strength just before it drops to nil over the range of only a couple of KHz. Here's the kicker: If I apply RF to the antenna within the noise bands, even a few watts, the noise goes away for ~5-10 seconds, then slowly returns. I know it's not the AGC of the receiver - it's a TEN-TEC 580D and is capable of semi-QSK. (Read _reel_ fast recovery). Could it be a static buildup on the antenna that is shunted to ground by my finals when I transmit? Could it be a piece of hardware on a nearby phone pole oscillating? Could it be ... Satan? If any OM out there has had experience dealing with strange interference, I'd certainly be in your debt if you'd shed a little light on this strange beasty, so that I can enjoy what's left on this sunspot cycle in peace! Thank you in advance from the twisted mind of:

In article <9006172224.AA03527@ucsd.edu> RDW2030@TAMVENUS.BITNET writes:
>The question is... what good ideas can you guys come up with to really get
>people to know about ham radio and what it does for them as well as what a
>great hobby it could be for many.

Here are a couple of ideas I've implemented.

A few years ago our ARRL Section Manager here in the Santa Clara Valley section started a speakers bureau. We found hams who were outgoing and could speak enthusiastically and *with a minimum of technical jargon* to service clubs (such as the Lions and Rotary) and other organizations. (Don't forget your county and city supervisors.)

To support this effort, I came up with a slide show and script illustrating the variety of ham activites in the area. I purposely only used photos of hams in this section, so that it would be more personal instead of just "hams somewhere are doing this." I did, however, show them hamming in other locations, such as for DXpeditions and emergency communications. I'd be happy to send the ASCII file of the script to anyone who wanted to use it as a template.

When the SM became Division Director, he asked me to write up guidelines for the speakers bureau, and he distributed them to other SMs and PIOs (public information officers, now public information coordinators) in the division. I don't think any of them ever implemented a speakers bureau, and his successor as SM didn't keep ours going. As far as I know, the slide shows are currently sitting on shelves somewhere. With only minor modifications (we can replace the Coalinga earthquake pictures with our own :-)), it would still be a fine show. Perhaps our incoming SM (I know you're out there, Steve!) can resuscitate these ideas.

More recently, in my capacity as an Assistant Director for the Pacific Division, I wrote up guidelines for hams who wished to write articles about amateur radio for *non-ham* publications. There are lots of hobby and professional magazines out there that would be great for ham stories, gang!! Rod publicized the guidelines in his newsletter, and I got about a dozen requests for them. Excerpts also appeared in "Field Forum", a newsletter from HQ for ARRL field appointees. I don't know whether anyone has actually produced any articles based on my suggestions.

That should give everyone a few ideas to chew on!

Patty

>McNatton) gave a list of US call letter assignments.

>This list didn't say anything about four-letter calls starting with N.
>Are these calls assigned to any service?

Four-letter calls as in:
1) N5KV? Those are ham calls, and, coincidentally, aircraft calls as well.
(US-registered aircraft are assigned calls that match their registration
number, and N#xx are legal airplane registrations.)
2) NAEF? I believe this block is assigned to ships of the US Navy.
3) N5KVXX? I don't believe four-letter suffixes are assigned anywhere.
4) NF5QX? Those are amateur calls, to be assigned when the KX5XX calls
are all gone.

```

Well, the Blue Angels have finished their performance at the annual Rose Festival Airshow in Hillsboro, Oregon. Using the information provided in previous postings, I was able to capture a lot of interesting stuff on the scanner.

The preset frequencies in the planes included 251.6 MHz (preset 8) and 307.7 MHz (preset 16), both AM. The soloists were on 251.6 MHz while the four-ship formation was on 307.7 MHz. According to what I heard, 307.7 MHz applies to the west coast.

The team this year includes:

#1 Cmdr. Pat Moneymaker (flight leader = "Boss")
#2 Maj. Chase Moseley ("Ace")
#3 Lt. Cmdr. Dave Inman ("Moe")
#4 Lt. Cmdr. Doug McClain ("Mad Dog")

#5 Lt. Lee Grawn ("Bush") (?)
#6 Lt. Matt Seamon ("Spurt") (?)

Note that I'm not completely sure of the tactical callsigns, as they're used *VERY* briefly during transmissions. It got real interesting during the last practice sessions before the show when #6 lost an engine. Fortunately these are F-18's, not F-16's!

Oh yes, Team America was here too, using 123.475 MHz AM.

ARRL LETTER - Volume 9, Number 11 - June 1, 1990 - Part 1 of 5

More bad news for the Shuttle

Space Shuttle flight STS-35 was postponed again just hours from launch on Tuesday, May 29. A reported hydrogen leak caused the launch to be scrubbed and no new launch date had been set at presstime. This flight is scheduled to carry astronaut Ron Parise, WA4SIR, and the robot packet "SAREX" (Shuttle Amateur Radio Experiment).

Techs Get Relief From Michigan "Scanner Law"

Technician class licensees now are included in an exemption to Michigan's "scanner law," thanks to the efforts of a number of state amateurs. Gov. James J. Blanchard on Wednesday, May 23, signed House Bill 4750, making the change official.

Although a law had been on Michigan's books for many years excluding "Conditional, General, Advanced, and Extra class" licensees, it apparently had never been prosecuted. The general feeling among hams was that they were excluded from laws pertaining to the monitoring of police radio frequencies, but in fact Technician class hams fell under the existing law.

Among the many hams who worked behind the scenes for passage of the bill were Don Spillman, WZ8O, an international representative for the United Auto Workers, and Dave Norris, N8HKV, a former police officer.

The signing ceremony was carried live via Amateur Radio, on 440 MHz to an in-car repeater parked outside the statehouse, then to a Lansing repeater and on to some 14 repeaters around the state.

Gov. Blanchard, upon seeing the bill before him, remarked, "When I was a young boy a friend's father had a ham station in his basement. I remember going there to 'tune in the world.'" Blanchard was carried live on the repeater hook-up.

Lobbying for an amendment to the law began in 1986, and in 1987 a bill identical to No. 4750 died in session.

On a related note, ARRL on May 16 filed additional comments with the FCC, citing its earlier petition and asking once again for federal exemption for Amateur Radio operations of all such restrictive local and state "scanner laws."

FIVE PARTICIPATE IN IARU SEMINAR

Another session of the US Telecommunications Training Institute concluded May 11, under the direction of IARU president Dick Baldwin, W1RU. Participants in the course in Amateur Radio administration, held in Newington, included communications officials from Jamaica (6Y5EE), St. Vincent, Thailand (HS1KPR), Hong Kong, and Aruba.

Baldwin was assisted by IARU Region 2 president Al Shaio, HK3DEU, and by members of the Headquarters staff. In addition to the bookwork, the students participated in a 10 GHz demonstration using Gunnplexers, set a new class record for constructing code practice oscillators in the lab, and got a taste of PacketCluster.

PacketCluster, under the guidance of ARRL Technical Manager Chuck Hutchinson, K8CH, settled the traditional question of which student had traveled the farthest to attend the seminar. Connecting with a local node of the Yankee Clipper Contest Club's network, the "Show Heading" (and distance) command revealed that Mr. Aran Promata, from Thailand, nosed out Chak-lum Ng of Hong Kong for the "DX award"!

FCC EASES 902 MHZ RESTRICTIONS

Amateurs in Colorado and Wyoming have gained some privileges in the 902-928 MHz range thanks to an initiative by the Colorado Council of Amateur Radio Clubs and ARRL.

FCC, while noting that "various governmental agencies" still have fixed services in the 902 MHz band, polled those agencies and found that amateur operations in certain portions of the band would not be detrimental. Thus, effective July 2, 1990, FCC has waived Section 2.106 Footnote US267 and Section 97.303(g)(1) of its Rules to permit amateurs in the restricted area to transmit in the following segments: 902.0-902.4, 902.6-904.3, 904.7-925.3, 925.7-927.3, and 927.7-928.0 MHz.

The order stipulates that amateurs "must not cause harmful interference to, and will receive no protection from, any interference due to the operation of industrial, scientific and medical devices (ISM), automatic vehicle monitoring systems or Government stations authorized to operate in this band."

Government users of 902-928 MHz will, according to the FCC Order, eventually move to new fixed service bands, at which time the Commission will "consider removing the area restriction on amateur stations entirely."

ARRL LETTER - Volume 9, Number 11 - June 1, 1990 - Part 2 of 5

"YOUNG HAM OF THE YEAR" NAMED

Mary F. Alestra, KB2IGG, 12, of Staten Island, NY, has been selected as the 1990 *Westlink Report* Young Ham of the Year, according to *Westlink*.

Mary, a seventh grade student at Rocco Laurie School, holds a Technician class license. She was selected from a field of candidates based on her work at IS-72 relating to the 10 meter "CQ All Schools Net" and dedication to recruiting new young hams through speeches, personal appearances, cable television appearances, and similar activities.

The award will be presented at the grand banquet of the ARRL National Convention in Kansas City, Mo., on June 9.

FORMER HAM ARRESTED

Richard A. Burton, formerly WB6JAC, was arrested May 17 for allegedly operating a radio transmitter without a license, following an investigation by Los Angeles area FCC engineers acting on complaints from amateurs. Burton was charged with three felony counts of violating sections 301 and 501 of the U.S. Code.

In the early 1980s Burton's license was revoked for various Part 97 violations. After his appeals were turned down he was ordered off the air but continued to operate using his rescinded WB6JAC call sign. On Jan. 15, 1984, U.S. District Court Judge Manuel Real sentenced Burton on four misdemeanor counts of operating a transmitter without a license. Following appeals Burton served seven months in jail and five years on probation.

On Monday, May 21, Burton pleaded not guilty on all counts, and was bound over for trial in early July. He could face up to six years in federal prison and substantial fines. (Thanks WA6ITF, N6AHU).

OTHER FCC ENFORCEMENT ACTIONS

- On April 26, the FCC seized four illegal CB linear amplifiers valued at over $1000 from R. H. Electronics of Magalia, Calif. The store is owned by Ray Hanson, W7KMM. The marketing, manufacture and use of illegal radio equipment violates Section 302(b) of the Communications Act of 1934, As amended, and carries potential criminal penalties. (FCC Public Notice, May 14, 1990.)

- Sue Swanson of Lago Vista, Texas has been fined $1000 for illegally operating on 27.970 MHz, a frequency allocated to the US Government for fixed and mobile operation. (FCC Public Notice, May 11, 1990.)

- On April 24, US Marshals, with assistance from the FCC's New York office, seized 27 pieces of radio equipment belonging to Dwayne Mayo of Jamaica, New York, after he did not respond to FCC directives to stop operating his CB equipment until television interference could be eliminated. The FCC's New York office told ARRL that "the seizure took place under Federal civil forfeiture provisions which were initiated by the US Attorney for the Eastern District of New York."

  The FCC received letters from 30 area residents who complained that Mayo's illegal CB transmissions caused interference to their televisions and telephones. After several FCC letters to Mayo went unheeded, the FCC fined him $1600 for unauthorized CB operation. (FCC News Release, May 11, 1990.)

CAJUNS SUPPORT WARC FUND

The Acadiana Amateur Radio Association, of Lafayette, Louisiana, has donated $250 to the ARRL "WARC Fund" for the defense of amateur frequencies. The funds were derived from a club hamfest.

"The membership of this association," said club president Carolyn Oubre, KA5IJU, "acknowledges the importance of WARC and understands that if amateur radio is to continue to develop and grow, both technically and numerically, our frequencies must be defended. We also acknowledge the outstanding accomplishments of the 1979 WARC ARRL team. To duplicate that effort will require the support of every Amateur Radio operator in the US, together with other societies of the IARU."

ARRL LETTER - Volume 9, Number 11 - June 1, 1990 - Part 3 of 5

BARBARA P. PRICE

Barbara P. Price, 55, died May 17 at Bulloch Memorial Hospital in Statesboro, Ga., after a long illness. She was the wife of Larry E. Price, President of the American Radio Relay League.

She was born in Waterbury, Conn., and lived in Statesboro the past 27 years. She was a member of Trinity Episcopal Church in Statesboro.

"Barbara was a frequent companion of President Price on his trips for ARRL and IARU," ARRL Executive Vice President Dave Sumner said, "and she supported him in the countless other ways that made it possible for Larry to devote so much of himself to Amateur Radio, while at the same time raising a fine family.

"We feel a great sense of personal loss," Sumner said.

Besides her husband, she leaves two daughters, Jane P. Brunner of Indianapolis and Carol P. Faircloth of Statesboro; a son, Steven R. Price of Savannah, Ga.; and two grandchildren.

The funeral and burial were May 19 in Statesboro.

Memorial contributions may be made to the Bulloch County Chapter of the American Cancer Society, PO Box 2027, Statesboro, GA 30458.

ARRL LETTER - Volume 9, Number 11 - June 1, 1990 - Part 4 of 5

AMATEUR CALL SIGN UPDATE

The following is a list of the FCC's most recently issued call signs as of May 1.

Group	"A"	"B"	"C"	"D"
DIST	Extra	Advan	Tech/Gen	Novice
0	AA0AZ	KF0KC	N0LVA	KB0GPB
1	WF1J	KC1UO	N1HOA	KA1VOO
2	WY2C	KE2TJ	N2KPW	KB2JYY
3	NZ3I	KD3SC	N3IAV	KA3WET
4	AB4VB	KN4ID	N4YWA	KC4QGP
5	AA5RQ	KI5FA	N5QJH	KB5MNR
6	AA6VL	KK6JU	N6YRK	KC6KPM
7	AA7EM	KG7DG	N7OQX	KB7KPA
8	AA8BA	KF8GC	N8MEX	KB8JTR
9	WR9N	KE9WJ	N9JOA	KB9EQI
Guam	KH2M	AH2CG	KH2EJ	WH2AMM
Hawaii	**	AH6KJ	NH6WL	WH6CHT
Alaska	**	AL7LZ	NL7TW	WL7BYC
USVI	NP2F	KP2BT	NP2DT	WP2AHB
PR	**	KP4QQ	WP4XS	WP4IYE

* All 2 X 1 call signs have been assigned in these districts.
* Note: N-prefixed Group C calls for the fourth and sixth districts have nearly been exhausted. After N4ZZZ and N6ZZZ have been assigned, the FCC will assign Technicians and Generals Group D (2 X 3) call signs.

ARRL INSURANCE PAYS OFF

At a sales meeting in early May, the Albert H. Wohlers & Co. insurers, carriers of the ARRL Ham Radio Equipment Insurance Program, released figures for claims paid relating to Hurricane Hugo and to the northern California earthquake, both of which took place in the autumn of 1989.

Holders of the League's plan were paid $48,104 for Hugo claims and $14,815 for earthquake damage. 13 Hugo claims were made, primarily from Puerto Rico and the US Virgin Islands; three earthquake claims were paid.

SECTION MANAGER ELECTION RESULTS

In elections just concluded, the following ARRL section managers were elected:

Alaska: Harley Steward, KL7IZZ;
Indiana: Peggy Coulter, W9JUJ;
Maine: Jeff Weinstein, K1JW;
Oregon: Randy Stimson, KZ7T;
Vermont: Mitch Stern, WB2JSJ;

Four races were uncontested and the following were declared elected:

Delaware: Bob Pegritz, KC3TI
llinois: Sharon Harlan, WB9SFT
Santa Clara Valley: Steve Wilson, KA6S
Wisconsin: Richard Regent, K9GDF

For details see "Happenings" in July *QST*.

SECTION MANAGER ELECTION NOTICE

July *QST* solicits nominations for section manager in the following ARRL sections: Eastern Massachusetts, Missouri, Nebraska, New York City-Long Island, South Carolina, Southern New Jersey and Western Pennsylvania sections. Incumbents are listed in every issue of *QST*, on page 8.

ARRL LETTER - Volume 9, Number 11 - June 1, 1990 - Part 5 of 5

ISRAEL SHORTENS "BANNED LIST"

On March 25, 1990, the Israel Ministry of Communications rescinded its prohibition on contacting neighboring countries with whom peace treaties have not been conducted. Consequently, Israeli amateurs now may legally contact amateurs in Algeria, United Arab Emirates, Bahrain, Tunisia, Jordan, Kuwait, Lebanon, Libya, Mauritania, Morocco, Sudan, Syria, Oman, Iraq, Saudi Arabia, Qatar, and both North and South Yemen.

Correction: Vol. 9, Number 9, referred to "CW subbands," which was inaccurate. The correct term is "non-voice subbands."

ARRL DX CONTEST PRELIMINARIES

The contest branch at Headquarters has released domestic high claimed scores for the ARRL International DX Contest, held last February and March, and while the Northeast continued its domination of single-operator scores on both modes, other areas of the country made serious inroads in other categories.

Exceptions to the single operator domination by stations in the first and second call areas include W9RE (second place CW, third on voice); N5RZ (number 10 CW); and NA8V and K0RF (both in the top ten on SSB).

On CW, WO0G, K4VX/0, and WN4KKN/5 all lead single band listings, while W0ZV and W7WA top single band 20 and 15, respectively, on SSB.

Official results are scheduled for October *QST*.

COMMISSION OFFICE MOVES

Effective May 17 the FCC Denver Office has moved to 165 S. Union Blvd., Suite 860, Lakewood, CO 80228 (303-969-6497/8).

QSL ETIQUETTE FOR SOVIET HAMS

In late 1988 a new world opened for Soviet Amateur Radio operators, when they received permission to send and receive QSL cards direct. In the February issue of their *Radio* magazine, G. Chilyants, UY5XE implores Soviet hams not to request International Reply Coupons from overseas (IRCs are neither sold nor negotiable in the USSR).

"...letters are beginning to come in," Chilyants writes, "to the [RadioSports Federation], the Central Radio Club, and to individual radio amateurs from foreign shortwavers, surprised by such behavior on the air by Soviet stations."

Chilyants offers the following advice on "how to make use of the right to give one's personal address over the air":

* "Give your address only when asked to do so by the other station, or after he has given you his;

* "Avoid giving your address when working DX stations and expeditions; your information won't be noted in the log anyhow;

* "It's not ethical to indicate the need for IRCs, much less the number of IRCs needed. These things will be determined by the other station. If there are no enclosures in the envelope sent to you, send your QSL via the bureau;

* "If one IRC is enclosed, send your QSL by direct surface mail; if two IRCs are enclosed, send your QSL by direct air mail." (Translation from *Radio* by Dexter Anderson, W4KM).

Subj: Uniden for Education

The following is straight out of the July issue of 73, in the QRX area... Uniden America is offering a quantity of their HR-2510 transceivers to schools who have a licensed radio amateur on staff authorized to operate on 10 meters. The school must agree to install the equipment. When it is no longer in use, for whatever reason, the equipment must be returned for redistribution to another user. The radio cannot be sold or re-donated. The HR-2510 operates between 28.0 and 29.7, for information on how to apply for an HR 2510, contact Paul Davis at (817)858-3300. TNX Uniden

From article <12598864092.8.POPYACK@TOPS20.RADC.AF.MIL>, by POPYACK@TOPS20.RADC.AF.MIL:
> I have tried the field day program (FIELDAY.ZIP) by Paul Cassel, VE3SY.
> It works well until I run the program to print the results. It hangs up
> all the machines I have tried it on. I would love to use this program for
> field day, but it is useless if it cannot print the results!

And here I thought it was something I was doing wrong! I tried to run fieldday on a Philips P3105 (XT compatible) and noticed a couple of undocumented features (hate to say "bugs"). It seems that the running total of contacts always lists 1 contact on each of the other bands, so the contact total is always wrong.

The other problem is when the contest is over and it's time to print things out. I tried running sortfd from inside the fieldday program and tried running sort-fd from outside fieldday. Either way made no difference--the computer hangs and has to be rebooted. Interestingly enough, I tried it again using different data and got "divide overflow" when I tried to sort.

I'd love to see these features ironed out. The program runs considerably faster than some other Field Day loggers I've seen (one of them also called "fieldday"). But, as was pointed out, if you can't print the results it doesn't have a lot of usefulness.

And I was all set to ask for CW keying of the DTR lead on the COM1 port (a la K1EA and K8CC). :-)

I'm sure that most hams have noticed, but for those who haven't:

Aircraft always have license numbers painted on them that follow the same scheme as radio transmitter callsigns, for international prefixes.

Why aircraft, and not land vehicles? I don't know about watercraft. Does anybody else?

Someone mentioned writing calls clearly on QSL cards to ensure that they reach the right person. I have been a manager in a small way for Usenet personality Trey WN4KKN, who was WN4KKN/KP2 for a day or two before and after operating KP2A multi-single in last year's WPX (which he won worldwide, yay...). Anyway, the cards that I have received for Trey, direct or via the bureau, now include *eighteen* different wrong versions of his call. And these represent just the cards that are correctly routed to me. A couple of cards went to AA5B who sent them on, some were made out "via AA4BT" but reached me through the bureau, and so on. Whereas many hams make up wall displays of their most exotic QSL cards, Trey is planning an exhibit of the cards with the wrong calls on them. I emphasize that it's not just 18 cards that had the wrong call, it's 18 different wrong calls among a much larger number of incorrect cards. OK, so it's quite a long call (and was only used on CW), but sheesh...

Subj: Making ham radio known

Mark & all...

Your remarks reminded me of some cards a club back home had. It was about the size of a QSL, and had printing about like a weeding or graduation invitation might.

It essentially commented about amateur radio in general, something about the local club, and the ARRL (it was, after all, an affiliated club!).

We all had a couple hundred of these, and kept them in the glove compartment (now called a map compartment, and barely big enough to hold maps!) and when we encountered a person who asked, we all had descriptions and pitches we practiced, then gave them one of those cards.

Gee, that was back in the early 70's.

Now, unless you carry a video or can do it in 'rap' you might not hold anyone's attention too long. :-)

But maybe a handout brochure is *-not-* that bad an idea, with addresses of the local clubs, description paragraphs (with pictures?) of packet, oscar, atv, etc., and of course, the emergency preparedness and dx stuff.

As a minimum, I went to one of those quick print places and for $10 or so got some cards made up with my name and address and phone number. In the center where the copmany name might be is my call.

Some QSL printers were selling those years ago as "eyeball QSLs". But in addition to giving them to fellow hams at conventions, they can be useful to give to non-hams. It at least says to that person, if you want to find out more, give me a call... On one occasion, I had an individual call me using the number on the card. They weren't too interested at first, but thought about it and called later.

%MSG5107-W-SBMON, SOAPBOX MODE ON

I think a first step is to THINK about what would you say to someone if they asked you about ham radio? The way we represent ham radio will be what we think about ham radio, or maybe what we think ham radio should be.

But a good idea would be to know what you want to say and even practice it a few times. Grab a friend who doesn't care and practice on them. (You might have to buy them a pizza to get the opportunity!)

The point is, if someone asks you and you just shrug and mumble something about dx and morse code, that leaves a pretty fuzzy impression.

Think about what you do in ham radio. Do you yak with your friends on the way to work on the 2-meter repeater? Well, what do you talk about? Do you exchange cookie recipes and talk about what was on TV last night, or do you discuss the merits of antennas and propagation conditions the past week?
I suspect you hear a little of both on some repeaters.

Do you go on transmitter hunts? Why? Do you work contests? Why? Realize my asking why is not a challenge to anyone personally. It is a challenge to the group at large to be ready to enthuse (is that a real verb?) others in what they do.

Ham radio's greatest resource isn't the hardware or the technology itself, it is the people that develop and use that hardware, that understand the need and the enjoyment of it. And even more so if they are ready to share that understanding and enjoyment with others.

%MSG5108-S-SBMOFF, SOAPBOX MODE OFF

Mark, good luck. I hope you can get a real movement going.

Great idea Mark, I know the flow of programs here on rec.ham-radio is not that high but it would sure be a nice adder to have a place to exchange programs. I'll contribute "PATHFINDER" since I wrote the program and am still getting a reasonable flow of mail on it. I don't have the time but there is a prescribed format for kicking off a new discussion group which this is what we are probably talking about. Can some one pick up the ball and run with it?

In article <andreap.645128686@s.ms.uky.edu> andreap@ms.uky.edu (Stephen
McNatton) gave a list of US call letter assignments.

This list didn't say anything about four-letter calls starting with N.
Are these calls assigned to any service?

Yes, all articles posted to the newsgroup go to the mailing list digest,
and all articles mailed to the digest get posted to the newsgroup.

I sign my posts to all newsgroups,

                    Conway Yee, N2JWQ

I have gotten at least a half a dozen requests by e-mail asking what N2JWQ
meant.  I explain and then offer to give them more information if they want.
At the very least, this increases the number of people who know about ham
radio.

                    Conway Yee, N2JWQ

P.S.  Nobody has yet requested any additional info about ham radio.

> (HINT, is your name and address up to date in the callbook? If not, WHY NOT?)

Barring typos in the callbook (notify the callbook people) your call and address should be up to date both there and with the FCC. The callbook gets most of its info from the FCC which brings me to the point I want to note. I should like to remind ALL that the FCC requires us to keep them up to date with our current address. This is necessary, not only from an enforcement standpoint but to enable easier written communications. It use to be adaquate to mail a hand written letter informing them of a new address but not any more; now one is required to file on an FCC-610 form (a valid one). This is also to your advantage, as Diana kindly notes.

(Not ranting, just a friendly reminder from one who cares.)

The type of filtering you are looking for can probably be accomplished
using Helical Resonator Filters. See the ARRL Hand Book or the RSGB VHF handbook
for design criteria.

> I'd like to find some good books dealing with VHF/UHF design techniques...

The RSGB VHF Handbook may be what you are looking for. Also give the
Ham Radio Book Store (Greenville New Hampshire) a call and ask for their
catalogue. It is quite good.

>The question is... what good ideas can you guys come up with to really get
>people to know about ham radio and what it does for them as well as what a
>great hobby it could be for many.

Here are a couple of ideas I've implemented.

A few years ago our ARRL Section Manager here in the Santa Clara Valley section started a speakers bureau. We found hams who were outgoing and could speak enthusiastically and *with a minimum of technical jargon* to service clubs (such as the Lions and Rotary) and other organizations. (Don't forget your county and city supervisors.)

To support this effort, I came up with a slide show and script illustrating the variety of ham activites in the area. I purposely only used photos of hams in this section, so that it would be more personal instead of just "hams somewhere are doing this." I did, however, show them hamming in other locations, such as for DXpeditions and emergency communications. I'd be happy to send the ASCII file of the script to anyone who wanted to use it as a template.

When the SM became Division Director, he asked me to write up guidelines for the speakers bureau, and he distributed them to other SMs and PIOs (public information officers, now public information coordinators) in the division. I don't think any of them ever implemented a speakers bureau, and his successor as SM didn't keep ours going. As far as I know, the slide shows are currently sitting on shelves somewhere. With only minor modifications (we can replace the Coalinga earthquake pictures with our own :-)), it would still be a fine show. Perhaps our incoming SM (I know you're out there, Steve!) can resuscitate these ideas.

More recently, in my capacity as an Assistant Director for the Pacific Division, I wrote up guidelines for hams who wished to write articles about amateur radio for *non-ham* publications. There are lots of hobby and professional magazines out there that would be great for ham stories, gang!! Rod publicized the guidelines in his newsletter, and I got about a dozen requests for them. Excerpts also appeared in "Field Forum", a newsletter from HQ for ARRL field appointees. I don't know whether anyone has actually produced any articles based on my suggestions.

That should give everyone a few ideas to chew on!

Ah, right, this reminds me of a couple other PR projects I've done.

One was a brochure for civic officials about ARES. Yes, stuff like that is available from the League, but I figured it would be more effective to show local examples of how we've helped in emergencies. I had it all written and ready for the Section Emergency Coordinator to review. He never did anything with it. Scratch that project.

Another was a flyer (actually, a series of flyers) for handing out at Field Day and other public events. It's just on both sides of a regular sheet of paper, and explains what we're doing and why. They came in very handy the times we had groups up at a 9,000-foot elevation parking lot running VHF contests and the California QSO party. The parking lot is right on the way to a national monument, so quite a few people came by.

Again, I'd be happy to send ASCII files to anyone who wants them.

This probably isn't worth a giant discussion, but there is a 2m weekly
net out on Long Island with the topic "Aviation" ... once, when I was
listening, someone pointed out that private pilots who were hams lucky
enough to have NA[0-9][other_stuff] callsigns could request the call as
their airplane license/registration ID, also (from the FAA).

Again, the letter X might come into play, because I seem to remember
X being reserved for experimental aircraft.

I am *NOT* a pilot and I am operating from memory here...just an interesting
note. Made me wish I had one of those calls ... and a pilots license ...
and an airplane ... and ... :-)

I am looking to the net for some information concerning VHF/UHF repeaters. I hope to gain some FACTUAL data, I am NOT looking for quotes from the data sheets, so please consider this when replying.

A couple of us are responsible for four VHF/UHF Amateur NBFM repeaters in our area. Two machines are on 2 meters, one on 1.25 and the other on 70cm. With such a small sample (and each machine has different equipment), we want to be sure that our systems are operating within a 'normal' performance range.

The main question concerns the use of band-pass/band-reject duplexers. If you are using another type of duplexer, please describe:

Optional, manufacturer of the duplexer (with model number):

When operating into bp/br duplexers (when the output of such is connected to a single feed-line/antenna system). Please answer (as you have experience) the following questions separately for the 146/220/440 MHz bands (600KHz, 1.6MHz, and 5MHz tx/rx offsets):

1) How much "measured" loss do you experience through your duplexer?

2) What is the VSWR (or reflected power) into your duplexer?

3) How much tx/rx isolation have you actually measured (i.e.: 100db?) ?

4) What is your duplexer configuration (i.e.: 3 rx and 3 tx cans) ?

5) Are you using a circulator or an isolator?

6) Are you using a "Z-match" device between your transmitter & duplexer?

7) How much output power are you running (power into the duplexers)?

8) Are the final output devices (last stage into the duplexer) tube(s) or solid state?

9) Are you using a "Z-match" device between your transmitter & duplexer?

10) Have you experienced a need for using coax of higher quality than RG-214 between the TX/RX and the duplexers (and interconnecting the cans) with respect to shielding/desense problems ?

Also, noting that we are an Amateur group (in other words, we don't have very much money to spend), we would like to build "Z-match" devices for our equipment (A.K.A. narrow-range transmatch). Does anyone have any design data, schematics, or other information on these devices FOR USE IN A REPEATER SYSTEM?

We would love to use a circulator/isolator, but the cost of these devices are severely limiting (to us). Does anyone have any suggestions on these devices (construction, alternatives, etc.)?

If you are not directly responsible for a repeater, but know someone who is, please foward these questions to the person who can best answer the questions.

If you desired not to 'clutter' the net you mail email any response to me at "rbono@necis.nec.com" or, if you think the net would be interested in this technical "dribble", post it!! Packet: NM1D@WB1DSW.NH.USA

    Thank you in advance,

    Rich (NM1D)

I have noticed that most of the club calls listed in the callbook state the name and address of the trustee (except for clubs which have purchased special listings).

This year, I will conquer this by applying for a special listing for K2GXT, but I wonder if it occurs to the publishers that our club license reflects the CLUB'S address, not the trustee's, and that this is a particularly annoying facet of club QSL'ing.

Ok Ok.....Geesh, I get the point....OUCH ;-)

Actually I have an idea VERY similar to this which had its' roots in trying to improve the support to affiliated clubs in our section.

Each of the field organization heads, i.e. the OO Co-Ordinator, Section Emergency Co-Ordinator, etc is required to come up with a 30-45 minute presentation about their respective areas. The idea is that any club can request one of these people to come down and speak at the club meeting. This has the two fold effect of providing the clubs with programs(which always seem hard to find) and getting the word out about services provided by the ARRL field organization.

There is nothing that says these presentations can't be aimed at a slightly more general audience like the Kawanas, etc. Or that we can't collect/encourage other presentations and make them available.

Gee Patty....did I see a volunteer to co-ordinate all this ;-)

We do have other programs running in the section (which I'm sure Patty is aware of) that are helping some to get the word out about Ham Radio. Most of these are spear headed by our PIC(Public Information Co-Ordinator) Randy, KK6BO.

The most recent addition to our efforts is the Childrens Discovery Museum in San Jose. There is a permanent ham station at the Museum which was donated by Kenwood. A club was formed around the Museum's exhibit to staff the exhibit during Museum operating hours.
Randy has been actively involved in getting this club and exhibit off the ground(there are several others who have put in a great deal of effort also!)

The section has also purchased a large banner which is available
for any club holding a public event to advertise the hobby. This
is another item co-ordinated by Randy.

These exhibits turn up a lot of names of people who are interested
in finding out more about ham radio. Our latest effort is aimed
at channeling the names of interested people to local clubs who
are holding classes(another of Randy's ideas).

I know of at least 3 articles in local Newspapers about ham radio
in recent months(one of which was in the San Jose Mecury News) and
two spots on TV. So we have been getting some exposure in the
local news media but they came to us as oppossed to the other
way around. We still haven't figured out a way to guarantee
an editor is going to print our news releases ;-)

Point to all this is that we are working on the problem on
different fronts. (And all of this was under the current
SM, Glen WB6W. I wish I could take credit for it all but can't ;-)
What it really takes is finding some people who are interested
in the problem AND have the energy to try new things. We
got lucky and found Randy.

I have had the misfortune to listen to 14.300 and 14.313 for the past few days, and wonder what *we* or the FCC can do to stop this mess.

I am not sure of the absolute legality of the MM traffic net, but I am certain that intentional jamming, obscenities, transmitting of CW passaages from nursery rhymes etc is certainly not permitted by the rules.

Two stations were most blantantly jamming. Both had Extra class calls.

It's tough seeing a nice hobby "circle the drain". Is the FCC considering any action against any of the participants in this childish dispute? Is the FCC totally useless as far as taking punative actions?

Since he says he needs a flat bandpass of 5Mhz (fast scan tv?), cans would
be too sharp. Coaxial cavity filters (cans) with any reasonable Q at all
will have a 3db point at about plus and minus 30khz. A better choice would
be a stagger tuned interdigital filter. A seven section filter could be
designed to have a plus or minus 2.5Mhz 3db passband. Trying to make it
phase linear could be tough though.

Subject: QRV 4 FD / Satellite info wanted

In case anyone's interested....

The USAF MARS Affiliates, Hawaii, will be QRV for Field Day from sunny Bellows Field Beach, Waimanalo, Oahu, Hawaii, working most modes/bands using the call KH6CTQ. Pete was pictured in the Handbook a couple of years back with his windmill he built especially for Field Day. It (and Pete :-)) will be doing yeoman duty again this year.

And now, a request....

I was intrigued with the possibility of actually making a satellite QSO
this FD, thanks to the AMSAT bulletins that were posted yesterday. Now
the question: Could some kind soul out in netland explain to a totally
uninitiated user how to configure my equipment to make some satellite
packet QSO's, as well as tell me where to find the birds?

Thanks in advance....and yes, I know it's kind of late, but isn't
adaptability part of what FD is all about? :-)

73,

Jeff   WD6CQV/KH6 AFA8JM

Let me know PLEASE if you get an answer! I have the same problem and have written him email on it. Also ftp'ed the file again just to make 100% sure that it didn't get damaged in transit... unlikely but I wanted to make absolutely sure. Same thing.

I am considering calling on the phone... I have no other replacement for the program and we now are counting on it.

Last ditch effort would be to take the data files after field day and write a routine to comma delimit them, or in some other way make them readable for DBASE or one of its many cousins.

What a bummer :-(

Subject: Dubious quality of CQ review of AEA IsoLoop
Summary: Where's the beef!
Message-ID: <1990Jun19.220825.2911@midway.uchicago.edu>
Date: 19 Jun 90 22:08:25 GMT
Organization: University of Chicago Computing Organizations

Posted: Tue Jun 19 23:08:25 1990

Just read the review of the AEA IsoLoop in the July CQ. Being interested in purchasing one the these antennas it was the first thing I read. . . but was pretty much disappointed with the "quality" of the review. The review seemed to me to be more of an advertisement for the IsoLoop than any kind of comparative critical analysis. Further, the "performance" characteristics of the IsoLoop were given as subjective judgements when in fact a quantitative comparison could have been used.

Here are some specifics...

A minor nit with AEA. . .

From the review it seems that to use the AEA IsoLoop you need "four-conductor control cable" that is not included in the package. It would seem that AEA could include such a trivial item without the buyer having to make another trip / phone-call / order to get this. What length to ship might be a problem. But, since the antenna is advertised to be "portable" (campsites, RVs, condos, etc) - some appropriate length consistent with these uses should be shipped.

X is better than Y - but whats Y ? . . .

The author compared the IsoLoop with his "old 20 meter" antenna and found a 2 to 4 S-unit difference between them on 14.105 - but he didn't say what kind of antenna he was comparing the IsoLoop to other than "old 20 meter". I think that when you say "X" is better than "Y" then you should tell us what "Y" is.

Propagation conditions or antenna - "It doesn't matter". . .

On transmit, the author seems to do a very unscientific comparison. Using the IsoLoop the author attempts a contact with a friend that he normally contacts through a node in southeast Arizona... he writes.. "There was a difference in the incoming signals that day, and the difference I was seeing Zip direct [not through the node]".

The author seems to confound the performance of the IsoLoop with propagation conditions. He didn't again try the contact with an antenna other than the IsoLoop. In fact, he writes this

> "Was it the conditions, or was it the antenna. IT DIDN'T MATTER.
> We were having fun batting it back and forth, discussing Hamcation
> at Orlando."   (Emphasis mine)

What kind of review is this - "It didn't matter" ?

Where's the hard numbers...

The author seems to make an uncontested virtue out of the very narrow/sharp bandpass. It seems to me that for receive and transmit one has to constantly adjust the antenna with the stepper motor. Depending how sharp this is, and how much deviation there is in S units across the tuning range and what kind of SWRs you can expect across the tuning range for different bands ... all this "tuning" could be a real bummer. The author never mentions any of this nor are there any hard numbers reported - like S unit ranges/comparison or any SWR performance data across bands.

So, I'm real disappointed with this review. Despite the review, I'm still interested in the IsoLoop and was wondering if anyone out there can do any better than this CQ "kid review" of the IsoLoop.

I'd like to know...

A S-unit comparison with a "known" other antenna. I just have a very simple 45ft dipole with traps. IsoLoop better than this ? What's the IsoLoop better than ?

Typical SWRs as a function of frequency. And maybe expected high/low SWR values across stepper motor tuning ranges within bands.

IsoLoop covers 14MHz-30MHz. Any possibility using this on outside this range (say 7Mhz) with an Antenna Tuner ?

The AEA IsoLoop is $319. I have a $100 dipole with 3 sets of traps. Is the IsoLoop better than what I already have ?

(I would of expected to derive the answer to this question from the CQ review - but I didn't. . .)

Thanks,
Gary

I agree with Ron Todd (no relation) that you should keep your address current. I recently received one of my cards back from an address that had an irate note to the postmaster that the individual had not lived at the address for YEARS, and she kept receiving the cards and other mail. I got the address from the 1989 callbook. So the individual is either still alive, or I QSO's with a bandit who is just using the guy's call.

Geez, you Americans get so HYPER ... :-)

What you're hearing about is IPARN - a group of people working on building a voice (and digital, someday) repeater network that will cover most of the populated areas of the country.

The first step was completed last week when repeaters in British Columbia (VE7) were linked with a repeater network in southern Alberta (VE6) via the Anik D3 (?) satellite and a series of UHF point-to-point relays. Unfortunately, they were a bit optimistic about the UHF link budgets. On one of the links an increase in air temperature over the path introduces enough attenuation to make the link unusable. When the temperature drops, the UHF link improves, but the Ku band satellite link degrades. (I might have this backwards but you get the idea). Right now the link only works within a fairly narrow temperature range.

I was in Victoria/Vancouver last week and had a chance to try it out. As per usual Murphy was traveling with me so nothing worked. The Vancouver end of the link is on 147.06+. Give a call there for more information. The Alberta contact is VE6AMC. You might catch him on the Alberta Public Service Net at 1830MDT on 3770 (or there abouts) weeknights. Or try the Trans Canada net Saturdays at 1800Z on 14140 (W's dust off your keyers :-)

If the FCC is really doing anything, I doubt they would be talking about it publically. As participants in this hobby, there is nothing that we really have legal power to do, other than complain to the FCC, or to the operator who is misbehaving (assuming someone else is not using their call).

I do however agree that the garbage heard on the Nets and DXpeditions on all of our heavily used bands is getting way out of hand, and will probably cost us some of our precious frequency allocations in the future. I even avoid tuning across 20 or 80 with a prospective new ham in the shack listening because of the illegal activities that are quite often taking place.

We are supposed to be "self policing" in many of these matters. I however feel helpless when I hear this kind of stuff going on. As any on the air response to these activities is only an acknowlegement to their (the jammers, etc.) effectiveness in having disrupted the Net or DXpedition.

Anyone have any ideas, or know what is proper procedure in these kinds of matters?

/dale

> Jim, WA6SDM

I'm sorry to be the bearer of bad news, Jim, but the data you are looking for doesn't exist. To be sure, a lead-acid battery does exhibit a *slight* decrease in cell voltage as it discharges, but the specific values depend on battery age, cycle history, maintenance history, etc. Your only hope would be to characterize each individual battery of interest to you. And then, those numbers would only be valid while the battery was at chemical equilibrium with no load.

The best (and sometime only) way to determine the state of charge of a lead-acid wet cell is to measure the specific gravity of the electrolyte.

Best regards,
Dan Blake

>Has anybody head DOVE on 2m lately?

Dove has not been transmitting on two meters since late March. It is currently the top priority of the microsat software development team and may be back on two meter FM as early as sometime next week. Meanwhile, listen for it on 2401.2205 MHz (+/- 100 KHz doppler shift). It has been transmitting there for weeks with no known problems.

Keywords:Sun Blew Up Again...

My limited experience this cycle indicates that the bands are not really dead...in fact this is a much better peak than the last one, which was a real bust (smoothed max sunspot count of only 90 or so, monthly average; this one came out to about 150, as I recall reading somewhere). Solar flares do cause trouble, as you note, and we may well be past the peak. We can only hope it's going to be a bimodal this time...

BTW, my experience has been that except for disturbances, the bands always have some life to them...I've heard 10m openings during sunspot valleys that would surprise anybody. It seems that what really happens is that everybody says "cycle peak is over, p*ss on hamming", and doesn't even try.

addresses..start harrassing 'em back!...>

Nice idea. Unfortunately most of the "bootleggers" actually speak Italian, not because the UK has a large Italian bootlegger population, but because Italy has a *HUGE* CB community, and with 10 meter propagation the way it is, they are usually 50 over 9 here. Most of them are running about 5kW erp to talk to their friends 2 miles away. Why do you think most of the CB "linears" available are made in Italy?

Nope...

Aerotron stole the 220 Mhz band and SOLD it to the first buyer willing to
help them do it, then a ham proposed PELTS which is TEN channels.

Ok... last time... this is your brain on info-hams...

```
ASDGLKJ#$^()*ERGIOGEGHPOIW$%IPO^&R}{P}{|}{O^%Y#PIOJ@W#%$PYOJW$P%OYJ$W%Y
@$OK@%TOPJK@#$T%JOP#Q$OTJPOJP:OJ|POJ}PO|J|POJP:_&^(OJ$%W^OPJ@#Q$%POJ$#%
```

etc. etc. for 50K...

Please please PLEASE don't post programs as mail messages to info-hams!! It's just a machine! It doesn't have the sense to put it at the end of the mailing, or even in a separate mailing! It sticks it in there like ANY OTHER MAIL MESSAGE... and then you have to scroll through 20 screens at 2400 (or faster if you're at work) before you realize that it's not going to end any time soon. Then you have to extract it to a file and jump to the end to read the messages that come after the program!

ACK!

Logger12 could have been uploaded via FTP to some site. If you don't have FTP, I'm sure something else could have been arranged. I hope I'm not the only one that thinks this was a bit uncalled for. On the VAX you read things ONE SCREEN AT A TIME... and it costs a lot more than a dime!

I have this old mobile rig from the good ol' days of crystals. It's the Yaesu Sigmasizer 200R. A 2m rig with about 50 crystals in it! Looking back in some old QSTs, it seems to be from about 1975. This rig was thrown in with the deal a couple o' years ago when I bought my Drake TR-4C.

The radio works excellently, with the exception of a couple frequencies. This may just be bad crystals, but I would like to ask if anyone has the manual and/or schematic for one of these. It's a great rig, and I plan on using it until I can afford something better (and after that I'll still use it for SOMETHING!).

Also... you Drake owners out there... how about letting me know if you have any mods for the Drake TR-4C. Also, I would like to know what the optional 34PNB noise blanker was made of (ie-could I make one myself or will I have to find this at a swap fest?). There is simply a jumpered tube-socket where this blanker goes.

Thanks for the help and please post to the list, because I am in the middle of account switching!

With the perpetual discussion about where the callsigns are, I should throw in that I just got my new call, and it is WZ2B, and it took 6 weeks (upgrade). Also, I have learned that N2KKK was skipped, so the FCC list of 'exceptions' (callsigns not to give out) apparently works :-)

Larry was asking about the possibility of recovering Gel-Cells. I have not had much luck with totally discharged cells. The Gates application book I have indicates cells should be re-charged if the cell voltage drops to 1.8 or 1.6 volts(I can't remember exactly) after sitting on the shelf. During actual discharge, the voltage can be permitted to fall to lower values as long as the cells get re-charged reasonably quickly.
Some cells will pass current with very high voltages (40 or more) and can be partially recovered, but not completely. The cause is apparently insoluble lead salts forming a high resistance in the cell if it remains in a discharged condition for too long. This is probably irreversable.

All that said, I am looking for a couple of BC cells in reasonable condition (2 volts, 25 AH) and reasonable price to complete a 14 volt battery. If you have a lead for me (or a lead cell- hi hi), please write.

Announcing new HAM!!   WB0GPX

My friend bought the Yaesu FT-411 handheld.

I confess, I haven't been following the posts about how to access the MODS database. The current set of information on my system doesn't contain any info on the MODS database.

Please post how to get to MODS, or how to mod the FT-411.

Thanks,

-> >Sensitivity of 0.5 uV
-> >Ability to withstand 1000V pulses on input without blocking or
-> damage.
->
-> This sounds a lot like a receiver with a Blocking Dynamic Range of
-> over 180dB. If such a receiver is found, Greg, let us know...and let
-> us know the price.
->
-> 73, Dube Todd N5PDK
Perhaps I phrased this badly. The receiver does not have to FUNCTION with 1000 volt input, merely not be damaged by it, and to recover immediately (in a few microseconds) as soon as the overload is removed. Most commercial receivers I have tried either suffer damage or block for several seconds following a gross overload. The signal I am looking for occurs in the few milliseconds following the overload. I think a tube front-end is probably essential - probably related to the electronic t/r switches used by some CW operators to achieve instant break-in.

Must have been another flare on June 14, at least we had a good aurora opening here in Europe (well, that's on 2m). The band was, from here, wide open down to northern F and OK at least until about 18UT.

Btw, not all hams swear about solar flares. HI. If you get tired of those dead HF bands, get yourself 100 watts, 10 elements and CW on 2m and have some fun! (Apology to all of you that live too near the equator)

My Gates manual shows the following voltages. The line is linear, so any other points are easy to calculate. Gates notes that the actual state of charge will be within 5% of the chart if the battery has not been charged or discharged for 24 hours.

Charge	0	25%	50%	75%	100%
Cell voltage	1.975	2.025	2.075	2.125	2.175

Note that this is open circuit voltage. The actual discharge characteristics are also relatively linear (except at the end!), but both of these voltages are temperature dependent. The Gates data sheet shows that the capacity varies from 50% of nominal at -40 deg C to 103% of nominal at 60 deg. C (nominal is at 25 deg. C). Most of my experience has been with the Gates batteries, so other batteries may have different characteristics. You might try writing to to the manufacturer of your battery for a data sheet.

We need a filter for a low-noise preamp in the 440 MHz range. Mostly it needs to have a flat passband about 5 MHz wide, and steep rolloff, especially on the low end. Can anybody suggest a solution that is more clever than your standard LC configurations? Sharper cutoff, less insertion loss?

I'd like to find some good books dealing with VHF/UHF design techniques...
my library covers HF and microwaves but has quite a hole in between.
Suggestions are welcome.

Rather than petitioning the FCC for new regulations that cannot be enforced, the users of CB need to arrive at a "gentlemen's agreement" about an advisory channel. I would think 19 (or 9 if it is life-threatening) are already for this purpose.

This presupposes that a traffic advisory channel is effective. I suggest attempting to hold a "traffic net" on a particular channel, plus advertisements on other channels. It may be that nobody has their CBs turned on !

Frankly, I'd be surprised if the anarchists on CB would allow such a useful service.

In metropolitan areas (like L. A.) weak signal VHF and UHF users (satellite operators) often use cans. There are cans (duplexers, single filters, etc.) for 440 MHz. Have you considered these? They are very sharp.

Our local cable company dropped the weather radar. I found that channel to be incredibly useful during (of course) bad weather, but also useful to alert me to band openings.

Does anyone know how the information from these radar sites is distributed? Has anyone have information on construction of equipment to receive this information?

This brings up an interesting caprice of the net. In the past when a for sale item showed up in the ham-radio group there were angry comments from the arpanet side and threats to close the gateway. Meanwhile on comp.os.cpm there are for sale articles on a daily basis but if a long source code file appeared there were angry comments from the Arpanet side and threats to close the gateway.

I have noticed the occasional long ham-radio posting in the past (yes even the occasional source listing) but they are greeted with nary a whimper.

What is the Arpanet policy? Is there a policy? Is this all dependant on the perspective of the gateway manager? So it appears out here in the land of little sticks.

Hello,
I'm not yet a ham, but I have a friend who is and he asked me to post and find out something about info-hams for him. Unfortunately he is unable to read news, but he can send/receive mail. Could someone please send us information on info-hams, so this poor young lad can indulge in newsfeed on a regular basis? All input is appreciated.

Thank you,
Jonathan S. Bucki

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

I've been noticing this too for the past week or two. I'm in San Diego, about 30 deg. north latitude. If I'm lucky I can hear WWV on 15 MHz...

I'm surprised that no one else has commented.

As I expected, I got some strong replies to my bitch about the uuencoded program stuck in the middle of info-hams digests... everyone seems to think I can just hit N and skip to the next entry... MY problem is that I wasnt to read what comes AFTER the program in the SAME digest! We have no means to undigestify, in other words.

Why can't we create a separate list for binaries? I know that is fairly standard practice. As one person said, posting them directly is a good way to see that more people can get them. I agree. But not in the middle of a digest.

What do you say, INFO-HAMS admin?? How about a separate list for programs? I'm all for the idea. I agree that it's a great way to distribute the programs! I would gladly subscribe. We have ftp, but others do not and I want everyone to have a shot at the software.

A couple weeks ago, I requested info on sources for 6JB6s, since Drake wants $26 apiece for them. This was before I even bothered to look at the RF Parts ads in QST. They want a whopping...

$15 each. Not bad. And I was all worried!

> check, but I never heard from them again.

This was a mistake on your part. They probably thought it was a donation to the club. They need 5x7.5 inch SASEs with your call in block letters in the upper left hand corner. They also apreciate donations.

When I left the island a few

> several months later and a note saying my funds were more than adequate.

Some bureaus will take money, and furnish envelopes with your address on them, but you have to check first.

Remember that you are dealing with a bunch of volunteers. The Willamette club does not sell credits for envelopes.

> That all was three years ago. I have not received anymore cards, notes,
> messages, nothing.
>
> Has anyone else had experience with the Willamette Valley DX Club? Is this
> standard practice? Is $20.00 the going fee for one-time pack of 30 cards? Do
> they ever explain what their policy is or their rates?

I have used the 7 area bureau for years, and never had any problems. But they handle the cards with SASEs (they HAVE to be 5 inch by 7 1/2 inch) just like all the other bureaus. The ones that take money and do every thing for you are the exception, rather than the rule.

According to The ARRL Operating Manual, only the 2nd, 5th, 6th, 9th,
0, Puerto Rico, KH6 and KL7 bureaus will "sell" envelopes and postage.

>
> Before thirty-seven of you refer me to back issues of QST, please no flames,
> but I like many other hams, am not a member of the League, and none of the
> local libraries carry QST, nor is it available on the newsstands.

I thought about posting the list, but it is too long. Write to the
ARRL, 225 Main St, Newington, CT, 06111 and ask for their sheets on
both the incoming and outgoing bureaus.

Anyone

> willing to post how bureaus are supposed to work? (Not just post references
> to read that we don't have access to?)

I already posted a long article the other day on how it all works.

Good luck!

I am interested in any modifications for the Radio Shack Pro-200x series
hand-held receivers.

If you know of any, I would appreciate any suggestions that you may have.

Thank you for any effort that you might be able to lend,

I am need of information regarding PRO-AM mobile antennas.

I have two HF PRO-AM whip antennas, one for 40 and one for 75 meters. When I got these whips, the instructions said to insert a capacitor in the mount from the whip to ground for proper operation. I have since lost the instructions and the capacitor somehow fell off the mounting and is gone. I need the information as to what size capacitor this needs to be.

As I recall, I used the cap specified for the 80 meter antenna, even though I frequently switched antennas as required. Without the cap I can't seem to get the SWR down on the antennas.

Please E-mail me the information as to the required values if you have them. I am leaving on a cross-country trip on the 25th and can't imagine going without mobile HF.

Thanks for any help anyone can provide.

73,
Michael

I suspect that the person posting the program didn't know about the gateway to the mailing list or he wouldn't have posted it; those flaming you are demonstrating their ignorance.

I was out of town. If I'd been around to catch it, the program wouldn't have appeared in the mailing list digest.

But really, folks, the chances of any significant number of people wanting any specific program on this newsgroup/mailing list is probably quite small; it would much more courteous to let people know that it's available and mail it to those specifically requesting it.

SB SAT @ AMSAT $ANS-167.01
FD OSCAR OPERATIONS, PART I

HR AMSAT NEWS SERVICE BULLETIN 167.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 16, 1990
TO ALL RADIO AMATEURS BT

Field Day An Excellent Opportunity To Demonstrate Emergency OSCAR Operations

This year the annual ARRL sponsored Field Day (FD) event will take place on the weekend of June 23-24, starting Saturday at 18:00 UTC and ending Sunday at 21:00 UTC. FD is a simulated emergency preparedness exercise which challenges all of its participants to set up and operate an amateur radio station under "less-than-optimum conditions." This year OSCAR stations will find their way into many FD sites for good reasons. First, there is the pure excitement of making satellite QSOs at remote QTHs. Also, there are the satellite bonus points which can be earned for making just one satellite QSO. More importantly, with the current availability of packet radio store-and-forward message capability on FO-20 and the advent of BBS operations on AO-16, LO-19, UO-14, emergency traffic handling will soon be possible from anywhere in the world. Using the current flock of packet radio message

satellites, there will be no place in the world which will not see several passes of these satellites per day. If a natural disaster should befall a certain geographical region, it will be possible for the PACSATs to provide additional capability to move "health-and-welfare" traffic in and out of the disaster area. With the current flock of PACSATs, small stations consisting of small, non-tracking antennas, small radios, and a laptop computer can make a simple PACSAT station in remote locations. Already, many PACSAT users are finding that a simple dual-band J-Pole antenna (see AMSAT Journal, March '90) will work quite well.
/EX
SB SAT @ AMSAT $ANS-167.02
FD OSCAR OPERATIONS, PART II

HR AMSAT NEWS SERVICE BULLETIN 167.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 16, 1990
TO ALL RADIO AMATEURS BT

Field Day An Excellent Opportunity To Demonstrate Emergency OSCAR Operations

FD will provide an excellent opportunity to not only test a simple station for PACSAT operations, it will also challenge those who want to use the other OSCARs such as AO-10, AO-13, and RS-10/11. With AO-10/AO-13, reliable emergency communications will be possible for a large portion of the northern hemisphere for many hours each day. For those who do not think it is possible to operate an AO-10/AO-13 station during FD, see the account of K8OCL in ASR #189. John describes the station that he and N8DUY set up for AO-13 during FD '89. Their simple station netted them 60 FD contacts and convinced them even more that it is possible to have fun with OSCARs on FD.

Still another reason to set up a FD OSCAR station is to expose and introduce other hams and non-hams to OSCAR operations. Many amateurs participating at an OSCAR equipped FD site will have an excellent opportunity to work PACSATs and OSCARs for the first time. Many non-hams who are invited to the FD site will not only have a chance to see HF operations, but will also experience what radio amateurs do with satellites. Today's non-hams are almost completely unaware that hams use their own satellites every day. Demonstrating an OSCAR FD station will certainly provide a surprise to both hams and non-hams alike.

AMSAT encourages all hams who will be participating in FD '90 to consider setting up an OSCAR FD station. Look for many new stations this year sending "CQ FD" on AO-10, AO-13, AO-16, FO-20, LO-19, RS-10/11, and UO-14. "GOOD LUCK and QRZ FD."

AMSAT SPACE SYM & ANNUAL MTG

HR AMSAT NEWS SERVICE BULLETIN 167.03 FROM AMSAT HQ
SILVER SPRING, MD JUNE 16, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Symposium to be held at Johnson Space Center

AMSAT has announced that the 1990 AMSAT Space Symposium will be held at NASA's Johnson Space Center Visitor's Center near Houston, Texas. The date for the weekend meeting will be October 19, 20 and 21 and it will be hosted by the Johnson Space Center Amateur Radio Club (W5RRR).

Registration will open on Friday afternoon, and tours of the Center will be made available not only on Friday but throughout the entire weekend. The tour includes areas such as Mission Control, the Shuttle Mock-up facility as well as the "Zero-G" Tank, a massive swimming pool used to train mission specialists for Shuttle EVAs (rubber rafts and water wings are not allowed).

The Symposium will take place on Saturday in the Visitor Center's Main Auditorium. It will feature talks on many aspects of amateur space communication and related subjects. There are sure to be a number of talks on Microsat operations. There will also be a talk on the results of the SAREX STS-35 Shuttle Mission as well as details of planned SAREX operations on STS-37.

The day will conclude with the now legendary "AMSAT attitude-adjustment hour", a Texas-style Bar-B-Que and the AMSAT annual meeting. Sunday's program will consist of a series of talks emphasizing how the average ham' can use the various amateur satellites - especially the newer Microsats.

Accommodations at a low-priced "convention rate" has been secured at the King's Inn adjacent to JSC. For more information on this year's symposium, send an SASE to: AMSAT, 850 Sligo Ave., Silver Spring MD 20910 or call the AMSAT office at (301) 589-6062.

SB SAT @ AMSAT $ANS-167.04
CALL FOR PAPERS

HR AMSAT NEWS SERVICE BULLETIN 167.04 FROM AMSAT HQ
SILVER SPRING, MD JUNE 16, 1990
TO ALL RADIO AMATEURS BT

First Call For Papers For the AMSAT-NA Space Symposium For Oct. 10-12th

The AMSAT-NA Space Symposium and Annual Meeting will be held October 10, 11 and 12 at the Johnson Space Center (JSC) in Houston, Texas. Coming, as it does, during a year in which two Shuttle missions are scheduled to carry licensed amateurs, this should be an exciting site for the meeting. With the added attraction of the Center's extensive museum and fascinating tours available, attendance could easily break all records.

However, in order to have a successful meeting, quality papers must be presented. This announcement is to solicit appropriate papers. The AMSAT-NA Space Symposium, to be held in the JSC Visitors' Center Auditorium, is intended to feature talks on the latest in technology in both the manned and unmanned aspects of the Amateur Space Program. Talks on MICROSAT utilization are particularly invited. The session Sunday morning at the Ramada Kings Inn will feature presentations aimed at the beginning satellite users and those wishing to try their hand with the RS birds, AO-13 and the

MICROSATs.

Those wanting to present papers are requested to send summaries to the AMSAT-NA office 850 Sligo Ave., Suite #600 Silver Spring, MD, 20910 by July 15, 1990. Those selected for presentation will be notified by August 1, 1990.

Final texts will be due in electronic form, either E-mail or floppy disc, by September 1, 1990. Reproducible figures and photographs will be due at the same time.

Let's make this the best AMSAT-MA meeting ever. Get your summaries in right away.

[A LATE BREAKING NEWS ITEM: According to Rich Ensign, at the Dallas HamCom 3 convention last week four more NASA Shuttle astronauts became Technicians and Ken Cameron upgraded to General class license. The AMSAT News Service (ANS) will get more details on names and calls soon but suffice it to say that both the Mission commander and the YL astronaut on board have now joined the ranks of amateur radio operators. STS-37 should be a real experience!

Congratulations to the crew of STS-37 for making it a foursome.]

SB SAT @ AMSAT $ANS-167.05
AO-13 ORBIT UNDER STUDY

HR AMSAT NEWS SERVICE BULLETIN 167.05 FROM AMSAT HQ
SILVER SPRING, MD JUNE 16, 1990
TO ALL RADIO AMATEURS BT

Many attentive satellite operators have noticed that the AO-13 orbit perigee has been decreasing steadily since the final orbit change maneuver was completed in mid 1988. This effect is not one of orbital decay but is a symptom of deep space perturbations, most notably from the sun and moon, which cause the eccentricity of an elliptical orbit to increase and decrease over a long term cycle. If the perigee at some point in the cycle is low enough, AO-13 will begin to enter the earth's atmosphere, decay will begin to dominate, and eventually AO-13 may re-enter catastrophically and be lost.

Several amateurs, OE1VKW, N4HY, N6NKF, G3RUH, KA9Q, and WA5NOM among them, have undertaken to learn as much as possible about these effects and to attempt to numerically model the AO-13 orbit as far into the future as possible in order to determine, if possible, what will happen. While most of these models project a re-entry for AO-13 sometime within this decade, it must be emphasized at this point that all results thus far are thought to be incomplete and therefore inconclusive. Formal errors resulting from projections months or years into the future still leave open the question of whether or when AO-13 will in fact re-enter prematurely.

AMSAT has contacted various institutions, including Millstone Hill (the radar complex that provided early orbital data during AO-10 and AO-13 burns), NASA's Goddard Spaceflight Center, and other NASA Centers in order to have the most complete possible analysis of the problem performed by experienced professionals. Any decisions or plans on the part of AMSAT must wait until after these results are obtained and fully understood. Bob McGwier (N4HY) expects to report as fully as possible in the upcoming AMSAT-NA Journal and in a presentation at the AMSAT-UK meeting in July.

[This statement was provided for ANS by N5BF.]

ZRO TEST SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 167.06 FROM AMSAT HQ
SILVER SPRING, MD JUNE 16, 1990
TO ALL RADIO AMATEURS BT

Station Receiving Tests Schedule Announced
You have one more chance to test out your receive station on AO-13 during the latest round of The ZRO Memorial Technical Achievement Award Program. The "ZRO Test", which is a test of operating skill and equipment performance, has been running over the past few weeks and will continue through the end of June.

During a typical ZRO run, a control station will send numeric code groups using CW at 10 words-per-minute. At the beginning of the run, uplink power from the control station is set to match the general beacon downlink strength. This is level "zero". The control operator will send and repeat a random five-digit number, then lower their uplink power by 3 dB (half power) and repeat the procedure with a new random number. This will continue to a level 27 dB below the beacon (level "nine").

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" tests on 435.945 MHz.

Saturday June 30, 1990 at 1840 UTC "JL"
Saturday June 30, 1990 at 1930 UTC "B"

Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures, means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

SB SAT @ AMSAT $ANS-160.08
AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 160.08 FROM AMSAT HQ
SILVER SPRING, MD JUNE 9, 1990
TO ALL RADIO AMATEURS BT

Transponder Schedule for AO-13 Effective 05MAY90

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130 (Mode S Beacon only)
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

The current attitude is:

BLON = 179.4 and BLAT = -4.1 for 25 Jun 90

Cross mode B and S QSOs are possible during MA 135 to 140.

AO-10's Mode-B Transponder Now Available for Use:

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

[AO-10 update received from Graham Ratcliff, VK5AGR, via AO-13 beacons.]

In article <7880154@hpfcdc.HP.COM> perry@hpfcdc.HP.COM (Perry Scott) writes:
>Rather than petitioning the FCC for new regulations that cannot be
>enforced, the users of CB need to arrive at a "gentlemen's agreement"
                                               ----------------------
>about an advisory channel.  I would think 19 (or 9 if it is life-

GENTLEMEN? Where! Where! Damned few I've heard on CB lately.
(There are exceptions, but they are few and far between)

But for the most part, "CB gentlemen's agreements" sounds like
"military intelligence" to me.

It's really funny just how many people have never heard of ham radio. They don't understand "ham" or "amateur" radio. I usually have to mention shortwave (such a misnomer!) and "talking to people all over the world" to ring a bell in most people's minds.

The question is... what good ideas can you guys come up with to really get people to know about ham radio and what it does for them as well as what a great hobby it could be for many.

This goes above and beyond the Radiogram service and the occasional passer-by that says "What's that radio for?" We hear this a lot at RDF hunts.

What unusual methods have you used yourself or seen other hams use to really get people interested in what was going on? We are in serious need of more grass-roots exposure, I think. If we can get some good ideas going, then we can possibly carry them out. I am a big ham radio evangelist, looking for more ways to let people know about it!

Mark Lowe - KB5III

I need the instructions/schematics, etc. for the Heathkit HD-15 "Hybrid Phone Patch".

Also, I have a 2-meter power amp by Heathkit, but there's no ID number or model number on the unit. It uses two transistors, type 2N6084. If any one has information, schematics, etc. Please let me know.

73,
Dube Todd   N5PDK

Part 1 of 3.
BID: $RTDX0615

Well, band conditions for the contest were not as good as one would have wished, but we cannot always get what we have wished for. But it could be said that they were fair, and from reports received it would appear that there will be some good scores showing up. At least we hope so. Now is the time for you to get to work and send your logs to 55 Prince Charles Road, Frenches Forest, Sydney 2086. If you do not know how to score, send them in anyway. We have a couple of good calculators that know how to do that.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JG1NBD, N2HOS, OD5NG, TG9VT and VK2EG. Thank you all for your efforts, and hope that you all enjoyed the contest.

RTTY DX Notes for Weekending 15th June 1990.
Part 3 of 3.
BID: $RTDX0617

Wednesday 13:
```

KR6N/KP4	14090	at	0025Z	QSL
HC1BV	14083	at	0200Z	
CE0ZIG	14073	at	0400Z	ARQ

Thursday 14:

8P9AT	14087	at	0410Z	QSL

QSL Information:

VK9LI will QSL via VK2SG as soon as the cards are printed.

IZ0MR/90 will QSL via I0IA.

UG7GWY asks for cards to be sent via Armenia Verevan Indeks 5, Padio Club, 375007 Armenia, Verevan, USSR.

KP6N/KP4 is via KP4USA.

8P9AT, Wolf Wagner, 12230 St James Road, Potomac, MD 20854, or via DL8KY.

Information Of Interest:

OM2BXW is a special call for OK land.

PP8BW is a special call for PY land.
And just to confuse you all, KJ is the stateside call, not Johnston Island, which is KH3.

ZD9BV has informed that the equipment that was sent to him has disappeared enroute. A search party has been dispatched, but so far they have not reported back that they have found the gear.

H44RW has informed that his RTTY gear will not work, so maybe we can forget the Solomon Islands for the moment.

ED9CI, Chafartnas Island should be active now by EA9JV. This will count for IOTA and prefix hunters awards, but unfortunately, not as a new country.

GL DE DX 1 (VK2SG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

Heywords: scanners, frequencies
Rdply-To: rcollier@rorie.hf.intel.com (Collier Chtn)
Nrganization: Intel Borp., OEL Microcomputer Platforls Divisinn, Hillsboro, Oregon

Well, the Blue Angels have finished their performance at the annual Rose Fdstival Airshow in Hillsboro, Oregon. Using the infnrmation provided in previour postinfs, H was able to capturd a lot nf interesting stuff nn the scanner.

The prdset frequencies in the planes included 251.6 MHz (preset 8) and 307.7 MHz (presdt 16), bnth AM. The soloists were on 251.6 LHz while the four-ship formatinn was on 307.7 LHz. Acbordhng to what I heard, 307.7 MHz applies tn the wert cnast.

The tdam this year includds:

#1 Cmdr. Pat Moneymaker (flight leader = "Boss"(
#2 Maj. Chase Loseley ("Ace")
"3 Lt. Cmdr. Davd Inlan ("Moe")
"4 Lt. Cldr. Douf McBlain ("Mad Dog")
#5 Lt. Lee Gravn ("Bush") (?)
#6 Lt. Matt Rdamnn ("Spurt") (?)

Note that I'm not completely sure of the tactical callsigns, as they'rd used *VERY* brieflx during transmirsions. It got real interesting during the last practicd sessions before the shnw when #6 lost an engine. Forttnately these ard F-18's, not F-06's!

Oh yes, Tdam America was here too, ushng 023.475 LHz AM.

```
Rules for 1st call area are similar, but not same. Money is accepted in lieu of envelopes, and we will buy envelopes on an as needed basis, if money is there to buy them (generally 10 cents an envelope or 25 cents for three, but this figure may differ from sorter to sorter). I ask that you do NOT put more than 25 cents on each envelope, but supply separate postage if you figure it may be more than 1 ounce. I do NOT hold onto cards for more cards to come in, although occasionally I will hold cards from one month to the next....for example, when I've already sent out one envelope and then find a few more cards missorted, rather than sending out another envelope, I'll just hold them for the next month. Please send envelopes NO SMALLER than 5 x 7"; they are difficult to find and tend to get lost... plus many QSL cards won't fit in smaller envelopes. As a courtesy, I will send out a postcard for hams who are in the callbook (HINT, is your name and address up to date in the callbook? If not, WHY NOT?), but have no envelopes on file, generally asking for $2.00 or $3.00 in postage/envelopes/cash, to open his account (and keep it going for awhile). This is NOT expected, and it DOES come out of my pocket, although we do request that the ham send 15 cents to cover the cost of the postcard, not all do (I guess they figure it's their right to receive a postcard). No response to requests for envelopes within 45 days results in cards being disposed and a big red "NO INTEREST DISPOSE" being placed on the ham's file card. When the last envelope, or low postage or money occurs, I send out an index card with the last batch, informing the ham of his status.

There are many cards that come in that are IMPOSSIBLE to determine who they go to. Foreign stations very often do not write clearly...I try to match up the cards as best I can using all available data. For example, if the QSL card has the receiver's first name on it, then I can start playing guessing names using the callbook: let's see, is it K1JTL, K1YTL, K1UTL, K1GTL, or K1TTL, Ah, K1JTL has the same first name, must be his, send it back to Call 1 bureau to be forwarded to the next sorter (this is only an example, but it gives you an idea of my thinking). If you get cards that don't belong to you, 'twould be nice if you returned them to the bureau next time you send in money or envelopes.....but not required...remember, that other ham may really NEED that QSL card, and sorters aren't perfect (at least I'm not :-).

To all Hams: DO YOU HAVE AN ENVELOPE ON FILE? IF NOT, WHY NOT?

CHEERS!
Diana

This is NOT necessarily true. A few weeks ago, I received a $10 check for
one of my "customers". Since this ham was a friend of mine and I had told
him earlier that his account was just fine, I decided to call and tell him
don't send the QSL bureau anymore money. He replied, "gee, I had sent in
a DONATION, not money for my QSL cards." Anyway, money to the bureau is
not necessarily assumed to be donations. You must specify that it is, else
it would be assumed that it is for future QSL cards.

By the way, I do have a few large customers....20-30 dollars....but most
just send 2-3 envelopes and/or 2-3 dollars.

>> Has anyone else had experience with the Willamette Valley DX Club? Is this
>> standard practice? Is $20.00 the going fee for one-time pack of 30 cards? Do
>> they ever explain what their policy is or their rates?

$20 would go a long way with me.....And yes, if you ask for information, we
have a page of data that we send, if you send a SASE requesting it.

someone wanted this info posted, so...
from my files:
>From: stan@hprpcd.HP.COM (Stan Witherspoon)
Newsgroups: rec.ham-radio
Subject: Re: Yaesu FT-411 mods?

To allow the FT-411 to recieve from 130 MHz to 174MHz and to transmit
from 140 MHz to 151 MHz, turn off the radio and hold down both of the arrow
keys and turn on the radio. Be sure to write down all of the contents of
your memories first as this will erase them ! This is the MARS modification.
Repeating this procedure will turn the FT-411 back into a HAM only transciever.
Refer to the mods server for a more involved mod that will allow you to
set the transmit and recieve frequency limits at will within the capability
of the rf deck.

WARNING: Do not transmit over the air outside of the ham bands unless you have
the appropriate MARS license! For other frequencies, don't transmit at all
because the FT-411 is not a FCC-Type-Accepted radio for the public service

bands! Also make sure that your radio can't accidently transmit on a public service repeater (in case you are all thumbs, or your radio gets stolen!)

Stan Witherspoon

Note: I haven't tried any of this, proceed at your own risk. WA2ISE

more stuff:
Newsgroups: rec.ham-radio
Subject: FT-470 neat whizzy stuff
Keywords: mods, crossband repeater

Well, since there's a lot of mod' req's floating around, I thought I'd mention something I discovered while attempting to perform a clone data dump on the Yaesu FT-470.

The Yaesu Customer Service Rep' that I called today claimed that the FT-470 *does* have a cloning capability despite the lack of instructions in the manual. Supposedly, the way to get into Clone Mode is to turn on the radio with the F/M key depressed.

HOWEVER! If you turn on the radio with the RPT key depressed, the radio becomes a crossband repeater. Try it! Dial up two frequencies you want to crosslink (be sure to pay attention to transmit offsets, if any), turn the radio off, depress the RPT key, and turn it back on. The tone encode/decode flags and the -+ flags will be flashing. When either band's squelch opens, the other band is moved into the primary frequency display and the transmitter keys. Note that the power output is decreased to Low power. One note: the crossband audio isn't great, probably because it's whatever comes out the speaker and gets fed back into the mike. I suppose if you got serious, you could create a short interface cable to plug into the top of the radio.

73's & happy dual/crossbanding!

A couple of weeks ago someone was asking about accurate time keeping,etc for an astronomical purpose. I just saw a half-card board for a pc that contains a wwv receiver and interface for a PC/XT or PC/AT type computer. It claims an accuracy of +- 20ms. It updates the system clock. It operates on the 10MHz signal. Cost is $225.00. The company is:

Coordinated Time Link
Santa Clara, CA
408-980-1305
408-980-1468 (fax)

I know absolutely nothing about this company. The above is what I read in a short magazine article.

"cans" are probably usually 1/4 wave coaxial filters - typically used in repeater duplexors. Since it's for a receiver you don't need the high power capability and should consider helical resonators - much smaller for one thing. I haven't any idea of a good reference for building

or designing them but you can get ready-mades from Digi-Key (Toko?)
tho' they're not real cheap. You might check out the recent ARRL
VHF/UHF book too.

Another data point, if people are still interested....

My first license (exam taken Feb 12th) took 5 weeks to the day to be
delivered in the mail.

My upgrade exam was passed thirty days ago today (May 12th). I'm still
waiting for my new callsign.

- Skip KK6HK (till the new call arrives)

Has anyone actually tried cashing an IRC? Are the USPO staff as clueless about cashing them as they sometimes are when you buy them? Some of those folks seem to have a hard job reading English, so the French on the front must be a real challenge for some of them.

One thing that's useful to know is that if the IRC originated in the USA you can cash it for 1 cent less than the face value. The others get you the equivalent of an overseas stamp for surface mail - so in principle you cover the return postage for a QSL card with one IRC, if you don't mind it coming back via surface mail. In my limited experience as a QSL manager, I always reply airmail if I am sent one IRC - the IRC is worth 45c to me, which is the overseas air postage rate, and although you may lose out by the cost of the card, that happens anyway when you reply to a USA card with an SASE. But then I'm just a Good Guy... (and I didn't buy the cards :-)).

I have this, er, friend, that has a number of IRCs that are incorrectly stamped (no stamp, or it's on the wrong side). This friend would feel happier cashing them in for 40c than sending them to DXers who might regard them as worthless. Are the USPO guys clued in? Of course, IRCs are rarely cashed, they get sold or traded for QSL cards, but when a new issue comes out someone must be left holding the baby. How much notice do we get when a new issue is imminent?

Happy QSLing -

+the problem (as usual) is getting the bucks up for the LNA, etc.
+
+bob Maccione..

There are lots and lots of used sat receivers out there. Since the
advent of scrambling, anything that doesn't have a built in descrambler
goes for cheeeeeep. You should be able to pick up the whole kit for
two hundred, minus the dish itself (receiver, down converter, lna, feedhorn).

I've even got one on the shelf.

>   [Lots of other stuff deleted...]

Interesting that the beam heading was correct from 6-land. In New
Jersey, he was peaking at 315 degrees! I've never heard Europe come
in from that direction on any band! :-)

I know we should WFWL, but that beam heading was just too ridiculous
for words!

By the way, our local packet reported XU1SS/ZA and ZA2PL today.
The saga continues...

Now watch, it will turn out to be real...

>   AA6KX
Here is an interesting piece of information. On Monday, I was discussing
the slim with Guy, KE2CG. Guy told me that at the moment the ZA was

posted on the packet cluster, he (KE2CG) happened to be in qso with Zoli, HA5PP! He told Zoli about it who got all excited-" Yeah? where is the guy, I want to go work him!"

According to most sources (including Guy, which is only third hand) Zoli's trip was purely exploratory, he brought no radios with him, and was a big success. He obtained official permission to operate from Albania, and should be on the air within 2 to 3 weeks.

Then you can work the real thing!

The title says it all. I just sat down for a nice peaceful evening of a little SWL'ing and Hamming (I do both)... AND the bands are dead, at least up here in the aroural zone (Marquette, Michigan, the land that time forgot)... When I say DEAD, I mean Dead. I can not get WWV anywhere. 75 meters is totally gone. SHORTWAVE stations sound like they are under water, and nobody is higher than S-2. Surprisingly, W1AW was there at 0130 with their bulletin on 21329.8 (announced 21390, they can not get closer to the freq than good old Glen Baxter can)...

Is it just ME, or is this the WORST solar peak you can remember. I mean dismal dismal dismal. Sunspots are supposed to being exciting stuff to the HF bands, but what the sunspot giveth, the solar flare taketh away.

Previous solar cycles brought me some great SWL reception, and wonderful memorable ham contacts with coathanger antennas all over the world.

Not so this time. This cycle has been a bust IMHO. The bands have been literally DEAD for days on end. No communication in or out. This is my THIRD solar cycle as an active radio nut. This time I have much more sophisiticated equipment, AND more time to play with it than the last two... (Well I used to skip school to play TV DXer when the e's came alive back when I was a kid...)

I have had very few memorable days playing with DX this time around. What I remember the most from this cycle is the total trashing of the bands many many many times. Some of it is the black hole effect (as posted previously) but I am sure that this dismal reception must be affecting others as well. Days when the band is "broken" seem to happen far more regularly than I can ever recall.

Thank goodness that usenet is not affected by solar flares (to a GREAT degree, though I blame a big one for bring lopez down... gotta blame something...)

I recently renewed (lapsed license, so a new call was involved).

After 3 weeks I got a letter saying they were processing my application.

The license arrived at about 7 weeks.

And similarly for the As, Ns, and Ws. While it seems to be the case that 1x3 and 2x3 "X" calls are reserved for experimental licenses, this is certainly not the case for the 1x2, 2x1, and 2x2 calls. I know W2XO and KE8X myself, and a quick persual of the callbook shows KB3XC and KB4XA.

You know better than that. If that was an attempt to be sarcastic, you missed.

It's an iffy question: ham radio itself cannot be used for commercial advantage, but the FCC has stated that buying and selling your own personal ham equipment isn't a commercial enterprise and so mentioning items in your shack that you'll trade for dollars (:-)) isn't against the regs. That might be relevant to how we treat the info-hams mailing list and rec.ham-radio newsgroup.

The newsgroup is a Usenet newsgroup, and as you know, anything goes on usenet. There is a ham swap newsgroup that is probably more appropriate.

The info-hams list isn't hosted on a Milnet site anymore, but at UCSD, a non-profit organization. We allow people here to put used equipment notices up on the various paper tack-boards around campus, and there is a swap column in the campus paper, so I'd suspect there's no rabid anti-money feeling by the administration as a whole on the subject of personal items for sale. I don't have an official policy decision on that and I'm loathe to ask. The various networks over which the articles travel undoubtedly have some sort of policies of their own.
A few months ago someone (Dave ?) resigned from the mailing list in a flaming Pyrrhic stroke claiming that it was illegal for his site to carry for-sale ads. So I've no solid feeling to go by.

I suspect that no reasonable person will mind an occasional mention that you have something that you'd like to part with by trading it for happy little bits of green paper, but I really don't want to encourage that because for some reason it really upsets the less stable element, particularly those at MILNET sites (although at the rate that mail is failing to hosts on the MILNET, they may never notice!).

So I'd like to encourage people to advertise ham radio items for sale elsewhere, and if you do see a message from someone ignorant of that guideline, please just GENTLY mention in a COURTEOUS way that it would be better for all concerned if they didn't do it again here.

Is this a reasonable policy that all can deal with?
     - Brian   (ayatollah of info-hams)

I recall a question posted here some time ago as to the current fate of DOVE, but never saw any replies. Does anyone know what's up with it? I also remember hearing that someone was uploading new software after the transmitter problem. What's the story?

Also, many thanks to all who helped out with the problem with my FT-101EE rig, especially Mark Bitterlich and Dube Todd. The problem is apparently a "classic" case of bad finals. When I get some time, I'll replace them, neutralize 'em, and see how it goes.

Telco tolerances have a fair amount of leeway.

In general, a telephone line can have well below 48 volts and still be within what the telco deems acceptable. If you live more than a few cable-miles from the central office, you should expect it! In some cases the telco will have a mux out somewhere, so you're not fed power directly from the CO but from someplace closer, at whatever voltage you end up with (usually okay). That can account for differences among different lines in a neighborhood.

The audio level is what counts. If you dial the milliwatt test number (usually nxx-0010 in CA), you'll get exactlly 1 mw. at 600 ohms (or is it really 900?). It's "normal" to have 3-9 dB loss in the wire, so if you get less than -10 dBm or something, using a properly calibrated test set, you may have a problem. Low voltage per se does not mean low level; it could just be the nature of your battery feed and wire combination.

It's also possible you are just on too thin a wire pair (maybe part of the way), or they're using a really bogus mux (like the "AML") which normally delivers inadequate levels. Have fun getting telco to own up.

I'm looking for a ham radio group called ASTUR (or something similar to that) which is supposed to have PD disks with various ham radio programs for the Atari ST.

The address which I have used before doesn't get a reply even with an SASE. Does anyone know if they still exist, or of a site I could download from?

In particular I need a graphics oriented great circle program and any new WEFAX stuff that might be out there.

Thanks in advance.

Does anyone have any experience converting the American version to the European
version? The 450 band changes as do the steps. This is for an Italian friend
who is in the US on assignment. Tom WA5QZM

Each Incoming QSL has its own rules, so what I am about do post is only
guaranteed to represent 3rd call area policy. First, to get a copy of our

rules, all we ask for is an SASE. We operate strictly on an SASE basis. You send us SASEs (5x7 clasp envelopes) with at least one unit of postage. If you expect larger volumes of cards, you can put extra postage on the envelopes. As soon as the weight of cards on file at the bureau matches up with the postage on your envelopes, we drop it in the mail to you. We stamp or write last envelope on your last envelope when we mail it to remind you to send more SASEs. As a courtesy, we send a onetime postcard to hams who have cards on file at the bureau, but no envelopes. If they don't send the SASEs within 45 days of notification, the cards are discarded and a note is made in the file to discard all future cards. Believe it or not I have over 6 pounds of cards for one very active DXer that will soon be pitched if he doesn't get his act together. Hope this explanation helps. BTW, I would send your bureau a letter with an enclosed SASE and ask for an accounting of your funds. 73

There was no transmitter problem with DOVE, a software problem caused the two meter transmitter to lock on making it nearly impossible to command.

Once control was regained, it was left executing from the onboard ROM loader (MBL) with the S-band transmitter only turned on. It has been reasonably healthy and safe ever since. The S-band transmitter is on 2401.2205 MHz.

At the moment, DOVE is top priority for microsat software development. A software reload (using the under-modulated S-band transmitter for return acks and nacks) was to have started last weekend. As soon as we're absolutely sure everything is right, the two meter transmitter will be re-activated. Shortly thereafter, some digitalker messages will be tested.

We are aware of the tremendous popularity and potential for DOVE with its two meter FM transmitter, therefore we have to be incredibly careful in developing, and later managing its operation.

>
> Just who is a "QSL Manager"?

He is someone who handles cards for another ham. Many times it is someone in the USA who handles QSLs for a DX ham. The foreign ham says "QSL VIA W6XYZ", and then sends W6XYZ copies of his log. If you want the DX QSL, you send an SASE to W6XYZ along with your QSL, and he sends a card back for the foreign ham.

Who takes on such a job and why? Are they
> "appointed" by a foreign ham,

YES.

and are there people clamoring to get

> these positions,

NO.

 or are they people who volunteer to experience drudgery
> and annoyance for the sake of a foreign ham who is a personal friend, or
> what?

YES.

 Is the usual thing that one person is a "QSL Manager" for many
> foreign hams, or is this a one-to-one thing normally?

It can be either. Some QSL managers do it for many stations.

 Are there "QSL
> Managers" outside the US, or is this something that is US-unique?

Yes, there are QSL managers outside the USA. I think that most of
them are here, just because there are so many U.S. hams who are in
the pileup collecting cards. But a QSL manager can be anywhere.
Going through a manager in a foreign country is not as easy, because
you need to send a donation rather than an SASE (unless you have a
collection of foreign postage).

>
> What is a "bureau"? Who runs it/them, and why? Does each country have
> one? Do they have any "official" status, like being registered with that
> country's FCC-equivalent?

Here is how a bureau (or BURO) works. They are not registered or regulated,
but are generally run by the national ham radio organization in the country
that they are in.

In the USA we have a bureau for each call area. You send a 5x7inch
envelope to the bureau with several ounces of postage on it, your
return address on the front, and your callsign in block letters in
the upper left corner. Actually, send several. The addresses are
printed in QST a couple of times per year, are also in the ARRL
Operating Manual, and are in the DX Callbook. They file it in
alphanumeric order, and when they fill up an envelope (or a long
time has passed with no more cards) they seal it and drop it in the
mail to you.

Overseas hams send bunches of cards directly to the ARRL HQ, and they
are then distributed to the regional bureaus. Every month or so the
volunteers at the bureaus sort the cards and mail them.

For outgoing cards, you can send these direct, send them to the
incoming bureau for the country, or use the ARRL outgoing bureau
(if you are an ARRL member). The outgoing bureau is great. You
pay $2/pound, sort your cards alphanumerically, and send them
off to ARRL HQ with your QST mailing label. At HQ they sort

them by country, and ship huge boxes of cards to the incoming bureaus of each country. This is the cheapest way to go, and will work for most run-of-the-mill overseas contacts, EXCEPT when the recipient is not using the bureau in his country, or only uses a QSL manager.

Note that the outgoing bureau is in Newington, and you incoming bureau is somewhere in your call area. When you move to another call area but don't change calls, you still use the bureau in your old call area.

.>
> When did this stuff start? Any history notes or comments?

It just sort of evolved.

>
> Post responses, don't mail them; this should be of interest to all the people out there who post "how can I become a ham?" or similar new-guy type queries.

OK. I hope this helps.

Ask the ARRL for copies of their sheets on the OUTGOING QSL BUREAU and the INCOMING QSL BUREAU. Their address is ARRL, 225 Main St, Newington, CT 06111.

You can also reach them via e-mail from usent at:

In article <31439@ut-emx.UUCP>, oo7@ut-emx.UUCP (Constructive Frivolling) writes:

> Has anyone actually tried cashing an IRC? Are the USPO staff as clueless about cashing them as they sometimes are when you buy them? Some of those folks seem to have a hard job reading English, so the French on the front must be a real challenge for some of them.

You hit the nail on the head here! The Post office is usually not fully aware of IRCs' unless you go to a big one, and catch the right clerk at the right time. Usually, they are more than willing to resort to a huge manual, and after a few minutes, determine that it is 40 cents per each dx IRC (which is why I usually sell them to other hams .....)

>
> One thing that's useful to know is that if the IRC originated in the USA you can cash it for 1 cent less than the face value. The others get you the equivalent of an overseas stamp for surface mail - so in principle you cover the return postage for a QSL card with one IRC, if you don't mind it coming back via surface mail. In my limited experience as a QSL manager, I always reply airmail if I am sent one IRC - the IRC is worth 45c to me, which is the overseas air postage

SOMETIMES! If you read the fine print, you can only get 1cent under face value if you are the purchaser of the irc! I recently returned from Singapore with a few hundred of these type of IRCs...and it took several trips to the post office before I was able to get 94 cents for each one. Usually, they tried to give me 40 cents...only once did the 'fine print' come into play. Face it, IRCs are a darn hassle!

> I have this, er, friend, that has a number of IRCs that are incorrectly stamped (no stamp, or it's on the wrong side). This friend would feel happier cashing them in for 40c than sending them to DXers who might regard them as worthless. Are the USPO guys clued in? Of course, IRCs are rarely cashed, they get sold or traded for QSL cards, but when a new issue comes out someone must be left holding the baby. How much notice do we get when a new issue is imminent?

I think the last time the issue was changed, there was a few year redemption period...this was about 10 years ago, i recall.
Sometimes a post office will redeem 'improper' stamped IRCS. I know that some QSL managers sell this kind of IRC for the normal 50 cents....which has led to a bunch of moaning about 'salting' the good IRCs they sell with bad ones. I personally pitch them, or return them with the QSL card with a stock note saying...these ain't worth the paper they are printed on. In almost every case, I usually get a note with either 2 (or sometimes more?!) IRCS in return that are GOOD, or a Green Stamp, or whatever. Most hams (and post offices) are uninformed of the proper method of issuing a IRC. It MUST be stamped on the left side (which says "Empreinte de controle du pays d'origine (date facultative).

cheers

How's your digital communications system doing these days ???
I'd be happy to hear about your system's capabilities/developments.
please direct your responses to the net or via E-mail.

Some info about Packet radio here in the middle east...

- The main frequency on VHF is 144.675.
- There are 3 active BBS's on this frequency in Israel and one in Cyprus.
  4Z4SV - JERUSALEM
  4X4HF - HAIFA
  4X1RU - HERZELIA (VHF-HF Gateway)
  5B4TX-6 - CYPRUS

- TCP/IP is used extensively by about 30 percent of the 200 or so active Packet stations.
- There are 10 active NETROM digipeaters scattered throughout the country.
- The BBS's use RLI or MBL software at 1200 baud. Each BBS has an additional port for TCP/IP
- Visitors are welcome to use the system to pass traffic back home.(Overnight delivery most of the time !) A laptop, HT and small TNC will get you country-wide coverage - from your mobile.
- Work is being done presently to have links done on UHF at 9600 baud.

Anyone using Full Duplex BBS's (with a dualbander-this sounds possible) ???

73,
Richard Harel

I had the opportunity to purchase a Yaesu FT73R UHF handheld.

This radio had been modified BY SOMEONE ELSE to operate as the commercial version FTH-7005. We have tried tuning it back to the ham band but can only make it transmit there, not receive. We could not see a jumper anywhere.

What we need to know is what do we have to do to REVERSE THE MOD and get it OUT OF THE COMMERCIAL BAND. The Canadian distributor couldn't help.

Anyone out there have any info?

A major flare occurred at 0541 UT, 12 June
A major geomagnetic storm began at 0820 UT, 12 June
A satellite proton event began at 1140 UT, 12 June
A polar cap absorption event began at 1545 UT, 12 June.

Last night (around 0300 UT), I couldn't hear WWV on any frequency, but
there was still a lot of other SW activity on the bands at regular
strengths.

Beautiful very pale green aurora seen from Fredericton. Quite
extensive; some patches directly overhead.

I tuned through 20 meters this morning at ~5:30 just to see if it was worth getting up and heading for the shack. I drew a complete blank. Many mornings over the last week or 2 it has been wall to wall with Australia and New Zealand, some of them running 20-30 watts. You can't get much more DX than that from the east coast.

Last week I picked up a British station working mobile (mid afternoon our time)

It has been boom or bust, but the booms have seemed pretty good to me.
Now I just have to get my antenna outdoors so I can get out a little better.

You mean the post office has to STAMP the IRC for it to be valid?
OOOPS. (They knew what they were here, but they took 10 minutes to
find any, and they only had 12, I bought them out.
Funny, because I sent 1 unstamped IRC to 2 people (Estonia and Austrailia)
and they came back very quickly with cards. The VK station even said
"Yes, the IRC will cover postage OK" (I know 1 IRC isn't enough for air mail,
but I figured it would help) [hey-I'm a poor, starving colledge student,
I can't afford IRC's :)]
Maybe I just talked to nice people :)

In the callsign database, is it really necessary to have both the
issuance date and the expiration date? With universal 10-year
licenses, I have only kept the expiration dates and have stripped
out the issuance date. This _seems_ pretty safe to me, and that

if I want to know when the guy got his license, subtract 10 years
from expiration. I want to know if there are any caveats or glitches
that I am missing in this assumption.

I have received a donation of a Morrow MBR-5 receiver. No docs,
no specs. It has an octal power connector, with no voltage/function
indications on it.
Does anyone have the power pinout for this ancient piece of gear?
I would love to get it fired up!
Any pointers to a source for the schematics/docs etc, for this
beast would be appreaciated.
Thanks,

(a FEW early units did require a diode to be removed)... simply hold down a few buttons when turning on the unit and keep them held until the unit is done with it's self test (Light-B-#).
>
> Well, to be adventuresome, I tried the "light-B-#" on my IC-2SAT. I didn't get wide-range receive coverage, but I did get ALL the LCD segments to turn on right after I powered the rig up. None of the other key combinations that NM1D noted seemed to have any effect.
>
> So, are the digital processors the same? Can these "software" changes be applied to other Icom handhelds? Has anyone found useful key combinations?

Maybe I wasn't clear enough... I made this mistake also...

Turn off the radio..
Hold down the Light, B and # keys (it isn't easy)
While holding down these keys, turn on the radio (even harder for two handed people!!!)

THIS IS THE IMPORTANT STEP

**** DO NOT RELEASE THE Light-B-# KEYS UNTIL THE SELF TEST IS OVER AND THE RADIO IS DISPLAYING A FREQUENCY ****

If you release the keys before the display has settled down, you won't enable the wide-range receive.

Or maybe you have a very early unit that requires the removal of a diode. My unit has a serial number in the 1900's, I am told (by a good source) that the 'first' batch of IC24A's required the diode to be removed. All other batches (from Japan) don't require the diode to be removed (of course, they could change this at any time!).

Also, keep in mind.... this was done on the IC24A... The dual band 144/440MHz handheld.... I have not tried this on a IC2SA/T, IC3SA/T, or IC4SA/T.

The combinations that change the number of digit-frequency-entry did work on an IC3SAT, but I beleive that unit had a diode removed to enable some 'extended' frequencies. If I had an IC2SAT, I might try removing the 'programming' diodes (they are very obvious), and 'see' what happens... One could always replace them (I hope) if the effect was not desired.

Good luck...   My wife (WG1G), still won't let me near 'her' radio... she loves it.... I guess I will have to get one of my own!

Hope this helps,

Rich

A local ham friend of mine is seeking to purchase a
used transverter for 6m and one for 432/435, both with
28 MHz IFs. For 6, he's particularly interested in the
Kenwood TV506, and for 432/435, he's looking for a Micro-
wave Modules unit.

If you have one of these transverters, or know someone
who does, could you please drop me a note via BitNet:
MROWEN @ STLAWU and I'll pass the information to him.

Thanks -

My wife recently (June 4th) received her Extra ticket (WG1G)... this was done through a VE upgrade... She received the ticket in 6 weeks (almost to the day).

Another local Amateur (WF1W), received his license in exactly 3 weeks, this was a call-sign change only (610 form sent directly to the FCC).

Local Novices have been receiving their ticket in 5-6 weeks.

Gee, how come when I was upgrading, I had to wait about 8 weeks!! Looks like I missed about 2 weeks of Amateur Radio activity :-)!!!

Rich

While tuning into an antenna with high SWR, my Yaesu FT-101B suddenly delevoped the following bug. The plate current refuses to dip on all bands except 10 meters, where it dips over in the 20 meter position.

Output power is similarly low (10 watts or so) on all bands except 10 meters, where it peaks at 70 watts. ALC, drive, and plate current appear adequate, so I am somewhat reluctant to blame the final 6JS6C tubes. Ideas/Suggestions?

This was an issue in California now that the N6aaa calls are nearly exhausted.
It was unclear whether or not the FCC would issue N6Xaa calls. But, my YL
recently got her Tech and it has an X suffix. So, it appears that there are
no 1x3 N calls reserved for experimental use.

I've heard of CB bootlegging for a while. I've heard things that have me a little confused though. It it people with CB radios modifying them to work on the 10m band or the other way around? I really don't see why a 10m operator would want to try to move onto CB...

Also, if a CB radio is on 10m, it's going to be in fullwave AM right? If you are tuning around on your receiver in SSB mode, will you receive it? Certainly you will hear something, but will you be able to dial it in so that it becomes clear? I believe I heard a fullwave AM signal once, I forget where (it was in a ham band). Does this always mean trouble?

Is it really possible to DF these things? Especially if there is a lot of skip propagation going on.

First we had CONELRAD. If you have a radio made in the 1950's, you will still find the little circle with a triangle in the middle of it at 640 and 1240khz.

In the late 1960's, I worked at a station that happened to broadcast on 1240 KHZ. Though EBS had taken over, and conelrad was no longer used, I still used to say "Where Listening is HOT on the CONELRAD DOT" as a funny one liner.

Anyway, Back in the 1960's EVERY SATURDAY MORNING, at exactly the same time (10:30 or so I do not recall the time, except that it was EXACTLY the same time every week) the UPI machine (In those days a klunking thumping mechanical TTY) would go into spasms. There would be 10 bells: BINGBINGBINGBINGBINGBINGBINGBINGBINGBINGBINGBING and a row of

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

and ten more bing bing bing bells....

And then:

EMERGENCY BROADCAST SYSTEM TEST...

THIS IS A TEST OF THE EMERGENCY BROADCAST SYSTEM

And a test message would follow.

We were required by the FCC to save these tests, and staple them to the station logs.

There was a "hook" (nail on the wall) where news was sorted, and the first hook was for EBBS tests.

They came during our local top 20 program, where I played the station's most popular songs as tabulated by requests of the past week. It was a busy shift, and "Tearing the wire" was mixed in with answering the phone, being the station's engineer, and drinking lots of coffee. At that small station in Ishpeming Michigan, I was the only employee there on saturdays.

Pegging the EBBS test was part of the routine.

So when I heard the bells go off, and the RED LIGHT above the console go on (Stepper relay wired to a BIG TRUCK TAIL LIGHT whenever the bell rang more than 8 times within a 30 sec period), I would go out and rip off the test, and stick it on the wall, and go back to playing the hits.

Well, to my surprise a half hour later, when we joined the NBC network, I was informed that a mistake had been made, and AN ACTUAL EBBS ALERT had gone out.

I ran to the hook and saw:

UPI

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

EMERGENCY BROADCAST NETWORK ALERT *** THIS IS NOT A TEST *****

THIS IS NOT A TEST. THIS IS AN ACTUAL ALERT. THE UNITED STATES

IS NOW UNDER ATTACK. ALL STATIONS ARE REQUESTED TO BROADCAST

THE EBBS WARNING MESSAGE. STATIONS NOT AUTHORIZED TO TRANSMIT

DURING A NATIONAL EMERGENCY ARE ORDERED TO LEAVE THE AIR. ONLY

AUTHORIZED EBBS STATIONS WILL TRANSMIT. FURTHER INFORMATION

WILL BE FORTHCOMMING

THIS IS NOT A TEST

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

I was absolutely flabberghasted. We did not have a xerox machine back in those days, or I would have a copy of the exact message in my files here (the above is only a very rough reconstruction of what I read.

Of course NBC mentioned that hardly ANYONE complied with the message as most people either figured it was a mistake, or did not even notice it (like me) because it came at 10:22 PM EST which was the standard test time.

This got me to speculating that if the RUSKIES (back then THEY were bad guys, not our huggy pals like in modern times) wanted to blow up the country, all they would have to do is plan the "big one" for just after 10pm on a saturday morning.

This incident caused a total revamp of the WIRE EBBS system, and I imagine someone lost his job over it.

Was anyone else working in broadcasting back then (It was 67 or 68 I think) on that fateful Saturday Morning? Does anyone have the text of the actual message that so many of us pinned on the wall without reading it because we saw the row of XXXXXXXXX's and went back to our business?

Radio. It was a wonderful Job. God, I'm glad I got out of it....

I own the PCS-5000 xcvr. Unfortunately, I don't have its operator manual,
and don't know how to use the PL tones, the Touch-Tones, and Repeater
programming shifts.

I would appreciate it very much if anyone could either get me the
Operator's Manual, or give me instructions.

I've breadboarded both the 2211 and 7910 modems. Well, well, the things you can get away with :-). The XR-2211 Carrier Detect circuit is pretty good. Essentially, it is "true" (1) when the PLL has locked onto a signal. If you use a large enough filter capacitor (Cd in the Exar app notes) the Carrier Detect will work pretty well, with a few notes:

1. It will trigger on any kind of coherent signal in the PLL lock range. A steady tone will trigger it (my TR-2600A HT makes a beep when you push a keypad button... this triggers it). This is essentially OK. I don't think the TAPR mod will affect this behavior.

2. A signal may fade briefly. This may cause CD to drop, and the otherwise good packet may be dropped. This will be more of a problem on HF. The problem is worse when running with persistance (like in KISS mode). If the TNC wants to transmit and is deferring to an active channel, the chance of him transmitting during other traffic is increased. The TAPR mod is said to improve this considerably.

The Am7910 is not as good. The CD output on that chip seems to be most sensitive to signal amplitude. Turn your squelch off, and DCD will always be on when the volume is at a good level for data. This keeps your TNC really busy receiving and throwing away bogus packets. Furthermore, the TNC may defer to an empty channel. Ughh.

I've ordered the State Machine DCD upgrade for my PK-88... this is supposed to trigger on actual valid looking data. This is probably the optimum for VHF use.

I love this stuff. One of my friends at home and I have done a little of this ourselves. He has a radar gun, and when the thought crosses our mind, we pull it out and play with it. The funnest thing was as you said setting off peoples' detectors. My friend, who is a commuter student there and therefore spends his life on the freeway has done this a lot more than I have. I've only seen it work one. Just not that many people have detectors.

This is one of the funniest things he's done. He saw some new slick looking car in the next lane going by, and noticed a curly wire coming down from one of it's sunvisors. Radar detector! He immediately got out the radar gun and took aim. The first thing to do is to switch it on and watch a row of LED's suddenly light up <zzzzzip!> The next thing he did was, using the "trigger switch" he switched the transmitter on and off repeatedly. The driver looked at the detector funny, adjusted knobs, smacked the thing around a little, etc and no doubt turned it off soon thereafter. Beautiful.

He got the thing mail order somewhere. It is a late model thing, that can measure speeds of other cars, even while the car it's in is moving. One guy he knows in AFROTC who he showed it to is in Explorers police division. He took a look at the thing and said, "You know, you have better equipment than the cops do?"

What is this source you mention? Also what are the deals with licensing with them? X band is just outside one of the microwave ham bands. We've never really worried about it. The most credible thing I've heard as a requirement is a Restricted Radiotelephone Operator's Permit, which we both have anyway.

27948 BF   1959   8 0529/2146 14995_KA5EJX K5KNC  ALL@NYNET ()
  Sb: TS-440S Software/New Version
```

We've just completed the beta-test version of The 440 Spoiler for controling Kenwood TS-440S transceivers. Version two incorporates high density display (color if you want it), total control of tuning by keypad, combined scanning of memory groups and frequency ranges, and more robust communication-port handling. You can now control a 440 from your PC sitting next to it or across the nation from it (through whatever voice and data paths you devise external to the program).

The package is shareware, and it's available on landline BBS ECHO (education) at 806-741-1570. Leave me a comment when you call to register, and I'll see that you're upgraded to download within a few hours.

I'll be happy to make you a copy of the package if you'll be so kind as to send me SASE (like a diskette mailer) and a formatted diskette.

Beta (user) testing lasts through June, and I would be very delighted to get bug reports or feasible suggestions for improvements during the beta-test period.

On the subject of points for packet radio contacts during field day:

(Please note that I am not on packet radio at all, the current bandwidth isn't high enough to interest me. I'm a snob I guess.)

I feel that points should also be awarded to all stations that are used as "repeater" stations. If points are not awarded for this, then people will try to prohibit others from using their stations as repeaters. This is a self-defeating concept, as networking (the big advantage to packet radio) can't happen under these hostile conditions. (I'm not commenting about the current technology, just the idea that station owners might try to prohibit others from using their sites.)

Also, I think that some people have published papers showing great advantages of full duplex repeaters for packet use. Why prohibit this technology during field day, if it is superior? (Oh well, nobody ever accused the league of sanity or intelligence. Here's just another example of how the league is impeding progress.)

My request for mods for the Pro-38 met with thunderous silence.  I have heard
from two sources that ``you can't do that''.

In the mean time, how about the Pro-2024?  The usual - restoral of 66-88,
800, more memory.  I note that this model is extremely similar to the Pro-2022
which has far more memory, and 800 coverage.

I'm considering IRCI and Fox Tango filters for my TS-430S. Does anyone out there in netland have an opinion as to which I should get? I plan on getting a 400Hz CW filter and a 1.8kHz narrow SSB filter. Thanks and 73.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

A new field day logging program is now available via anonymous ftp at ucsd.edu (128.54.16.1) in /pub/hamradio. FIELDAY.ZIP was tested by our club (VE3IC) last year. The author, Paul Cassel (VE3SY) has done an excellent job. Please try out this program and let me know what you think of it. I will pass on your comments to Paul.

Good choice of terms. They're correct.

> The secondary stations, in the event of an emergency, tuned to one of the
> primary stations and rebroadcast it. The EBS equipment rack included
> tone detection, etc. and a specially packaged AM radio (not mil-spec, though,
> supposedly of lower quality than the cheapest auto AM radios).

In the OLD days, we used 'semi-cheap' rack mount radios that operated on carrier the carrier detect idea. You tuned it to the Primary EBS station for your region and pressed a button to lock a relay to silence the receiver. As long as the primary maintained a carrier, the receiver stayed quiet. When the primary ran a test, they started by turning the plates off and on on the transmitter 3 times to trigger all the monitors at the secondary sites, then ran a cart with the old familiar tone followed by the "....If this had been an actual alert, you would have been instructed...". When a primary ran a test, the secondaries only logged it but ran their own according to a set schedule. If a REAL notification came through, secondaries were supposed to tell people where to tune (just like the old Conelrad 640/1240 stuff) then sign-off, NOT rebroadcast material. I guess the idea was to cut the clutter and make sure ONLY authorized info was disseminated.

> I think this is why there is divergent opionion in this discussion from
> knowledgeable radio station people - the EBS implementation varied, depending
> on what kind of station it was installed in.

Basically it's the same now except the old carrier latch receivers have been replaced with the dual tone decoders and there are now several more levels of alert as opposed to the old "The sky is falling! Run for your lives!" approach :-)

As to the tapes everyone is talking about, some stations still keep the scripts in a copy book for the console operator to read and others have them already canned so all the jock has to do is stuff in the cart, hit a button and run for the shelter (:-) again)

STS-35/SAREX MISSION DELAYED

HR AMSAT NEWS SERVICE BULLETIN 160.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 9, 1990
TO ALL RADIO AMATEURS BT

STS-35/SAREX Mission Delayed Possibly for Two Months

This week NASA engineers and technicians found the hydrogen leak which prevented the lift-off of the shuttle Columbia (STS-35) on May 29th. Because of the danger of an explosion from a hydrogen leak in the engine compartment, NASA officials scrubbed the launch and worked up a plan to find it. The leak was located between two plates that connect the shuttle and the external tank. Since this is considered a major repair and one that cannot be performed on the launch pad, Columbia will have to be rolled back to the huge Vehicle Assembly Building (VAB). The roll-back will happen sometime next week and the repair of the leak and the return to flight readiness status of Columbia could take about a month. Complicating the repair work is the planned launch of the shuttle Atlantis (STS-38) for mid-July. Since Atlantis is carrying a secret military payload, it has national security priority over the scientific mission of STS-35. NASA officials now are saying that it could be August before Columbia and the STS-35/SAREX mission can get off the ground.

STS-35 is planned to be an all scientific shuttle mission carrying the ASTRO-1 observatory in its cargo bay. Also flying aboard as a secondary experiment is the Shuttle Amateur Radio Experiment (SAREX) payload. The SAREX station consists of a packet radio ROBOT TNC, a 2 meter FM hand-held transceiver, and a Grid laptop computer to be operated by Payload Specialist, Ron Parise (WA4SIR). The special software written for this packet station will allow amateurs to receive a QSO number after they successfully connect with the station on packet. Also, the plan is for WA4SIR to conduct 2 meter FM voice QSOs with amateurs on the ground.

Please stay tuned to AMSAT Nets and for further updates on the STS-35/SAREX mission.

ZRO TESTS CONTINUE

HR AMSAT NEWS SERVICE BULLETIN 160.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 9, 1990
TO ALL RADIO AMATEURS BT

Station Receiving Tests Continue

The following Mode "B" and "JL" ZRO tests remain in the current test rotation. They are scheduled for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" tests on 435.945 MHz.

Saturday	June 16, 1990 at 2200 UTC	"JL"
Saturday	June 16, 1990 at 2340 UTC	"B"
Saturday	June 30, 1990 at 1840 UTC	"JL"
Saturday	June 30, 1990 at 1930 UTC	"B"

Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures and means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

NOMINATIONS FOR AMSAT-NA BOD

HR AMSAT NEWS SERVICE BULLETIN 160.03 FROM AMSAT HQ
SILVER SPRING, MD JUNE 9, 1990
TO ALL RADIO AMATEURS BT

Nominations Period for Three Seats on AMSAT-NA BOD to Close Soon

Nominations are sought for the AMSAT Board of Directors. Directors are elected by the membership for a two-year term. Any member society or group of five members may nominate someone (a member) to run for the position.

This year there are three seats to be filled. Those directors whose seats are up for election are Phil Karn, KA9Q, Tom Clark, W3IWI, and the seat vacated by the resignation of Vern Riportella, WA2LQQ.

All nominations should be sent to AMSAT BoD Nominations, 850 Sligo Ave #600, Silver Spring, MD 20910 to arrive no later than June 15, 1990.

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 160.04 FROM AMSAT HQ
SILVER SPRING, MD JUNE 9, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date UTC	Time	Phs	Mode	NCS	U.S. Day
15 Jun 90	0115	104	J/L	N5BF	Thursday
26 Jun 90	0115	144	B	N5BF	Monday

For information on the amateur satellite program and how you can participate, contact AMSAT-NA at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 160.05 FROM AMSAT HQ
SILVER SPRING, MD JUNE 9, 1990
TO ALL RADIO AMATEURS BT

Transponder Schedule for AO-13 Effective 05MAY90

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130 (Mode S Beacon only)
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

The current attitude is:

BLON = 179.2 and BLAT = -2.8 for 11 Jun 90

Cross mode B and S QSOs are possible during MA 135 to 140.

AO-10's Mode-B Transponder Now Available for Use:

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

[AO-10 update received from Graham Ratcliff, VK5AGR, via AO-13 beacons.]

I can't help you myself but you might try to contact Rich Muller's group
at LBL in Berkely. About 5 years ago they were working on a mini cyclotron
to use for very precise mass spectrometry/Radioisotope dating.  They needed
a stable, wide-band frequency source and found that one of the Kenwood
transmitters would do the job better and at a fraction of the price
of a lab-grade signal generator.  Couple of his grad students ended up
getting their tickets as a result!

I grabbed this program from ucsd.edu and it appears to be excellent! (Thanks Randy!)

This brings up an interesting question which is apt at this time of year. Does anyone know of other good field-day logging programs written for older machines such as the Apple II+ (or in my case) for some of the CP/M machines? I really hate to consider taking my mega-buck 386 to field day for logging purposes.. but the old Model-4 would be absolutely perfect! Call me old and nervous... but a generator running my computer makes me a little queasy! :-)

Anything buried in the recesses of SIMTEL or any other FTP sites?

>
>Is anyone aware of software that will emulate a TNC?

It depends on what you mean by "emulate a TNC". Your typical TNC can be broken into three major pieces:

1. AX.25 link level protocol and user interface software
2. HDLC frame encoding/decoding
3. 1200 bps modem

Software is definitely available to do #1; I've written it. It's part of the KA9Q "NOS" package. Although it was written primarily to support TCP/IP over amateur packet radio, it does include a full-blown AX.25 and NET/ROM implementation (the latter thanks to W9NK and SM0RGV).

However, there is no truly practical way to do #2 except in hardware, which does not come standard with your garden-variety PC clone. HDLC boards are available from several vendors (DRSI, PACCOMM, HAPN) that plug into a PC bus. In the early days of amateur packet radio there were software packages that emulated HDLC chips, but they were extremely slow, clumsy, and prone to losing or corrupting data. Don't bother with them.

As for #3, the type of modem most amateurs use (Bell 202) is so obsolete that it is now quite rare in the non-amateur world. Contemporary telephone modems do NOT support this mode of operation, so you cannot use it and be compatible with other amateur packet users. The HDLC boards I just mentioned all contain on-board 202 modems, since they are specifically designed for amateur packet radio use.

I recommend the plug-in card approach if you will always use your PC to run packet, and especially if you want to use or experiment with higher level protocols like TCP/IP. The "TNC" was designed for an erstwhile era, when everybody used dumb terminals. It makes much more sense to build packet stations around computers, not terminals.

I've redirected followups to rec.ham-radio.packet.

Phil

In "canremote!greg.trice", Greg Trice writes a need for a receiver with,
among other things, a

>Sensitivity of 0.5 uV
>Ability to withstand 1000V pulses on input without blocking or damage.

This sounds a lot like a receiver with a Blocking Dynamic Range of over
180dB. If such a receiver is found, Greg, let us know...and let us know
the price.

In this age of "turtle madness" n1nja (unassigned) would be a good
'1'. :)

Some interesting letters I learned from a calculator game book:

6,9: G , 2: Z, 4 (as most people write it) Y or A

In the Russian alphabet, 3 is the character for 'Z' and would
also make for a good 'E robatne' (sp?)

When the FCC runs out of N's for Regions 4 and 6, where will they go
next? If they go to NA4AAA, think of what will happen when NA1's
are finally assigned!

Who got lucky on VHF Friday night? :)

Back in my college days, at Steven's Tech (which I soon left, and went
to and graduated from Syracuse U, a *real* college), someone at the
college radio station WCPR (carrier current) found a joke version of
the EBS test on some comedy album, and put it on cart. Later on, one
of the jocks played it on the air! Instead of the dual freq tone, there was
the sound of a flute. Good thing that we were not a *real* radio station
broadcasting over real air.

The previous posting of usa ham call words was incorrect. The following is the corrected list. Note that capitalized words are proper names. Fully upper case words are acronyms. Quite many of these have never been assigned by the FCC, so this may further encourage you to get the FCC to allow us to request vanity callsigns. DO NOT use any of these words for passwords, as they were derived from /usr/dict/words which also means some proper names are not capitalized.

{re: carts machines @ some stations}

It may be hard to believe, but there are stations with no cart machines. WFMT in Chicago comes to mind. NO recorded commercials allowed--the announcer read it, or you didn't hear it. Just imagine, no blabber music at all. No SAVE SAVE SAVE at Ed's Edsel of Edgewood.

Sure wish the rest of the world got WFMT.

Diane, they may be 90 cents now, but that would be a price
decrease. I have some postmarked april 90 that are definitely 95
cents. Don't know whats going on....!

This would be logical, but from rumors, perhaps the FCC won't do this.
I've heard they intend to just let Tech's and General's be stuck with
the novice calls out of the KC4AAA and KC6AAA and beyond groups.

They might be holding the NA1AAA group for Communicator.

I am interested in purchasing some used 2 Meter equipment
and wondered what I would expect to pay for 2M mobile equipment.
I know of an ICOM unit for $195, however it does not have
a touch tone microphone (TTM) which I want. I'm told it has
a standard 8 pin connection, and would accept other ICOM TTM's.
A catalog I have shows a couple close to $60, so the rig would
come out about $255. Is this a reasonable price for a 4 to 5
year old 45 watt 2M rig?

Note to hams in the Portland/Salem Or. area: Can anyone tell
me the name of the person that runs the Saturday morning swap
from 9 to 11 on 147.020? I believe his name is Doug and lives
in Salem. I evidently copied his call incorrectly and lookup
was for the wrong person. I've got a borrowed hand held, but
until license shows up (another 5 weeks or so) I can't give him
a call on the radio so would like to phone him. E-mail direct
to me if you know his name or call.

I, and several others, are searching for TCP/IP sources which have been ported to SCO Xenix.

Sources, assistance and/or leads most appreciated.

Thanks!

Not being a programmer is sometimes a real drag...

I'd like to find the sources for a logging program written for Unix or Xenix, or a DOS version written in C which has possibilites of being ported.

I'd even be willing to purchase such an animal if it were available.

Any help, sources, binaries, leads or other info greatly appreciated.

Thanks!

Noel

Ref QSL INbound bureaus.

I never knew exactly how to use a QSL bureau either. After many years of hamming, the DX bug bit when I was on an island in the Pacific and I could work lot's of DX without pileups, what fun!

Anyhow, I started getting DX cards and asked a local ham (the only other one on the island) about DX cards. He received about a shoebox full every couple of weeks, but he was a little more ambitious than I. He said he just sent the bureau a check and they sent him his cards and let him know when the money ran out. Sounded good to me. Not knowing the going rates for this service I sent a letter to the Willamette Valley DX Club (W7 bureau per the CallBook) along with a check for $20.00. They did not hesitate to cash my check, but I never heard from them again. When I left the island a few months later and moved to Michigan, I sent them a change of address and waited for cards. I had been told by someone that cards can take a long time, so I waited patiently. During that year on the island I had worked around 1500 DX stations and sent cards to the foriegn bureaus for most of them. After a year, I figured I had waited long enough and wrote another letter asking what the deal was. I received a package of about 30 cards several months later and a note saying my funds were more than adequate. That all was three years ago. I have not received anymore cards, notes, messages, nothing.

Has anyone else had experience with the Willamette Valley DX Club? Is this standard practice? Is $20.00 the going fee for one-time pack of 30 cards? Do they ever explain what their policy is or their rates?

Before thirty-seven of you refer me to back issues of QST, please no flames, but I like many other hams, am not a member of the League, and none of the local libraries carry QST, nor is it available on the newsstands.

How about it. Any members of the WVDXC out there to answer up? Anyone willing to post how bureaus are supposed to work? (Not just post references to read that we don't have access to?)

Thanks and 73,
Michael WA7SKG

This posting is good advice. I usually use greenstamps, but even where they're OK (which is most places) you always run the risk of the local P.O. workers filching the money. Thus foreign airmail stamps do help sometimes. I get mine from William Plum, 12 Glenn Road, Flemington, NJ 08822. An SASE will bring a price list. Generally the stamps will run you $1-$1.50 so it's reasonably priced against a greenstamp. And I agree with the above - the return is on average quicker.

P.S. - My PO charges 95c for IRCs also. You gotta watch the USPS employees, though - a lot of them don't know what they are, and even more don't know which side *they* stamp it on (if it's stamped on the wrong side it's invalid)!

At my home there is an interface box between the Pac Bell line and my house wiring. Inside the box there is a standard phone connector which connects the output of the box to the house wiring. On the Pac Bell side of this box the line voltage is 48 volts. On the house side the voltage is 20 Volts.

All of my phones work fine with this Voltage.

I called Pac Bell about the low voltage in the house before I discovered the box was cutting the voltage in half. The technician I talked to was quite surprised that the voltage was anything other than 48 Volts.

Since you are doing something which is interesting, I suggest you try to identify the person who tried to follow up on what he did for you and establish a friendly relationship, like you were trying to get him interested enough in amateur radio to get a license. Such inside help should go a long was towards getting your problem fixed and make getting future help from the phone company a lot easier.

Good luck,
Bill

In V1 #15, <usc!snorkelwacker!mintaka!ogicse!littlei!foobar!jim@ucsd.edu>
(aargh!) asks;

<...The seller said it was a CB radio from England. Is this correct?...>

I doubt it. It sounds like it might have been a UK spec machine once upon a time, and someone has hacked it. Currently, the UK has two allocations at 27MHz. One starts at 27.60125MHz, and runs up in forty 10kHz channels to 27.90125MHz. The channels are numbered sequentially from the bottom. The other allocation, which is the CEPT European allocation, is the same as the FCC allocations (complete with that curious hop, skip & a jump). Both allocations are allowed 4 watts of FM from type-approved equipment into restricted aerials (basically, no beams). The UK allocation will be withdrawn at some point in the future, leaving the CEPT one, although no-one will pay any attention, after all, there are 500,000 rigs out there. There also used to be another 40 channels at 934MHz, but I believe this has been withdrawn to make room for cellular phones. The conversation's no more intelligent, but everybody involved makes more money.

<...Besides
the wider band coverage, the FM aspect intrigues me. I wish it was this way in the U.S. Instead of all the heterodynes, imagine how peaceful a "silent pileup" might be...>

Hah! In urban areas with 500 other people on the same freq as you, you can forget capture effect, especially since half a dozen of them will be running 400 watts into big aerials (why, Ghod only knows). And you still get heterodynes.

I just wish we could keep them out of 10 meters, since the UK CB allocation finishes just below the CW segment of 10. There are enough people who can hack the PLLs to give them access to all these "silent" (they can't hear the CW, and don't care anyway) channels. Sigh.

73, Hugh.

I am at work and don't have a CFR handy but I believe the reason the FCC will not continue the N series is due to a conflict with another service; the navy.

Part of A, all of W & K & N are assigned to the USA by the ITU. The USA has in turn broken down what services can use which letters and in what combinations. So, a 2x1 N call is not just arbitrary, it has been designated for use by the amateur radio service.

You act too fast in eliminating the TM-701A, which does
indeed have separate antenna jacks for VHF and UHF.
With the readily available mods, it is a fine
unit for consideration of your needs.

Indeed the real message was sent back in the early
1970's. I was a poor university student working at
KOB radio in Albuquerque at the time, and though it
did not occur on my shift, I recall the incident
clearly. I believe that it was a Saturday morning,
and the message came over the AP and/or UPI wires
to the news teletypes. These emergency messages had
a certain format (10 bells in a row?) that set off an
alarm on the newsdesk. The skeleton staff on duty
at most stations did not event notice the alarms and
messages, or else ignored them. The message contains
an authentication code, which is to be compared with
the daily codes in a sealed envelope sent to every
participating station. If no occasion exists to cause
you to open the envelope (alert) then it must be
returned, unopened, to the coordinating agency.
Each envelope had code words for 1 or more months.

Some stations, fairly consciencious about their duties,
did see and act on the message right away, and alerted
their listeners. The rate of response was dismal, something
like 1% of all stations noticed and acted on the alert.

It has often been speculated that the "accidental"
sending of the real codes was itself a test, which
indicated that in the event of a real emergency,
you would not have been instructed about anything,

and the first warning most americans would have would
be the flash.

Hello net:
I have a problem trying to build a Gamma match for the driven element of a portable, knock down 2M beam.

I put together a 5 element, .8 wavelength NBS yagi as per the book (using 3/16 inch insulated elements). The frequency the antenna is designed for is 144.1 and since I want to use it on 144.2 I figure the errors aren't enough to require scaling.

The problem is in the matching of the driven element. I can't get the match down as far as I would like. (A similar driven element for 2M I built some time ago has a very good match although the construction is not exactly the same.)

```
------------+------------------------|---------------- < Driven element
            |                     ---|--------------------
            |       --------------   ^ shorting block.  ^match rod
            +-------        ^ Matching rod.              extends beyond
            ^     ^ Capacitor.                           driven element.
            Coax connector.
```

(The match rod bends evenly up from the cap to the shorting block.)

The shield of the coax and it's connector is connected to the center of the driven element (inside the boom, actually). The capacitor in the center conductor is formed by a piece of 3/16 inch brass tubing about 3 inches long and a 3/32 inch rod insulated with shrink wrap inside it. The rod then extends out to the shorting block where it connects to the driven element. The capacitor is parallel to the DE and approximately 1 inch away at the center but the rod bends in to about 1/2 inch separation at the shorting block. I find that the only acceptable match occurs when the rod is actually longer than the DE. There is about 8 to 10 inches of rod beyond the shorting bar in this case, and trimming it

back increases the reflected power substantially. (I also had a similar problem with the match on the DEs of some K1FO 432 yagis I built a few years ago. They used a 1/2 wavelength delay to feed the T match and the match rods had to be 1/2 inch longer than the DE on both sides to get an acceptable match.)
I haven't been able to find any design "rules of thumb" for any type gamma or T match. What sort of spacing is reasonable between the match rod and the element? (The single driven element referred to above has about 1/4 inch spacing and a reasonable location for the shorting bridge. Also, the match rod is cut off just beyond the bridge.) Should I try to decrease the spacing? Should the rod be closer in diameter to that of the DE? Is this effect a characteristic of the DE being too short or long for correct resonance? The elements are all supposed to be insulated. Would this effect occur if the outer conductor were shorted to the boom at the center if the DE?

Regards, Stu Beal, VE3MWM, (U009@CS.CCIW.CA),
National Water Research Institute,
Burlington, Ontario, Canada.

The future lies ahead. And behind us lies, lies... lies.

This past Sunday (June 10) I had a qso with a person using the call ZA5DX. Normally, I'd write this off as a slim, but there are several things that give it a faint note of credibility:

- There was an article in last week's "DX Bulletin" that Zoli, HA?PP, is now in Tirana trying to get permission to operate as a ZA;
- Zoli (aka XU?DX, XU?CW, etc.) usually gets the calls ending in "DX" (for SSB) and "CW" (for CW);
- The ZA5DX I contacted gave Zoli's call, HA?PP, as the QSL route.
- The guy was experienced at working pile-up's, and seemed to have the same style as Zoli.

On the other hand, there were some slim indicators:

- This was a CW contact, and he was using the "DX" suffix;
- Later in the day I picked him up using the call ZA5CW--on CW;
- He got some modest pile-up's going, but nothing like I would expect a real ZA would generate;
- While the signal was coming from the right beam heading, it was a little too strong for the high A index we had, and I didn't hear many other Europeans quite so strong;
- He kept taking too many breaks, but he was on for quite a few hours.

Does anybody have any more information on this one? I surely would like to believe it's for real, but I'm already well on the way to "worked all pirates" and would just as soon note add a new one to my collection. Did anybody else pick him up?

AA6KX

Sorry I can't get to Jim Carver direct.
Yes the seller was correct CB in the UK is FM. I'm sure you should get a
reply direct from the UK detailing the channel allocations which are also
different and do not have the spaces for remote control.
But it was decided to go FM, (which does make a lot good of sense) for
several rumoured reasons, To get away from the thousands of illegal US type
CB's, To allow all vendors to have an opportunity to supply the CB's, and
just to be different !

I am listing two transceiver radios for a friend who wishes to sell them. They are as
follows.

1) STS model AV7600VOR handheld 118.000 to 135.975 mhz

vor freq 108.000 to 117.975
manual included

2) Ten Tec TT920 Aviation band handheld good condition
no manual but manufacturer can provide one.

Please e_mail your offers. These are both excellent tools for emergency air
to ground communications as well as navigation backups incase of nav
equipment failure. Scanner fans will enjoy the programming features of
both radios.

Thanks e Guinn

This doesn't really belong on rec.ham-radio, but the idea was not to reduce clutter. The idea was to reduce the number of radio sources the enemy could use for radio direction finding, to get a bearing on targets. Remember this stuff was all pre-satellite navigation, etc.

I've gotten a couple E-mails on this, so I figured I'd post this. The side the IRC must be stamped on when you buy it is (I haven't bought one in awhile, so I hope my memory is good) is the left. To be sure, look at it. It's the side marked `imprimee de poste d'origine' or some similar phrase in French (the official language of the IPU) which stands for place of *origin*. The other side is reserved for the postmark of where it is *redeemed*. See why it matters now?

I worked OM7AN on Sunday and he gave a direct QSL address in Czechoslovakia. He said the OM prefix was a special event thing, but didn't say what the special event was. I've been trying to find out, but no luck so far.

>> on the other end of the tests, played the wrong tape.

I have the honor of knowing the officer in charge of that test... what happened was that they were running a test and hooked up the input that was simulating missles coming over the pole, but someone forgot to unplug the outputs to the Early Warning System. Most of the stations on the East and West Coast ignored the war message, but middle America wet it's pants. The guy I know didn't have enough rank to get fired for the screw-up, so they fired his boss.

It's a great story -- it might even be true. You know what military stories are like...

>are calling impedance is a pure resistance.

The mic element had been removed from the PTT/mic assembly and the leads had been desoldered. I put the ohm meter across the two terminals and got the above reading. The mic element is from the mid 1970's, and is ~3/4 inch thick and ~1 inch in diameter. Interestingly, it's identical to the mic element in a 1976 Midland CB radio I have (I wanted to make sure that the mic element in the Yaesu mic wasn't bad; the Midland was known to work). There may be something other than pure resistance in there, but I don't have the equipment to really check for it.

>If by keying the transmitter you get a different-from-normal reading with

>compared to what the rig's mike connector wants to see. Sounds more like
>a keying-line problem to me. I'd double check the connector wiring for the
>mike against the FT-101 schematic.

I think I stated that the readings were normal for no modulation, but that the meters weren't reading anything signifigant when modulation was applied.

Checking the wiring on the mic and making sure it matched what the FT-101 wanted was the *FIRST* thing I did. Additionally, I *did* have a local QSO with a couple people despite the meters reading no output power (they *do* read appropriate value when tuning up into a dummy load or doing CW). This would indicate that the mic & PTT are working normally; for some reason the meters aren't catching it...

>Regards,
>73,
>Dube Todd N5PDK

Based on some more testing into a dummy load, and the input of a couple people on the net, I get the impression that the meters on the

FT-101 and the Drake MN7 are too *SLOW* to provide accurate readings on the upper HF bands. All was working as it was supposed to be in the lower HF bands (at least to the Cantenna... :)

I'll borrow a good wattmeter (comparable to Bird) from the Cornell ARC and do some more checking tonight. Now for 10m to open up... *sigh*

Anyway thanks for the input, Dube; hope to catch you on the air sometime.

A friend of mine is visiting from Moscow (Soviet Union, not Idaho) and would like to find literature about building and maintaining satelite receivers. They've put together one system that can pull in CNN, and they'd like to be able to get more. This is an area that I'm totally unfamiliar with, so any pointers at all would be useful. (They have limited space and limited resources, so if you know of something that talks about how to do this on a shoestring budget, so much the better.)

Thanks,

I knew the conditions were bad enough that I didn't even bother trying to work this one. So I took off driving (ugh!) to Seattle to see some visiting Russian hams I know who were visiting with the Western Washington DX Club. It turned out that the main guy I had gone up to see--UA3ABW--had gone over to Vancouver to work WPX as a VE7 (he could get permission to operate from Canada, but of course in the U.S. it's not quite so simple). He went up with KE7V, who is quite a good contester, and they did a multi-single entry. Net for the two of them for the whole weekend was about 800 qso's. Not bad considering the conditions, but on the grand scale of contesting that's pretty miserable. Knowing KE7V as I do, that will probably be one of the higher scores recorded.

Actually, PE1CHL's version of the KA9Q NET program includes a full TNC-2 emulator, but it does require an 8530 board for operation.

+Seriously, is there a good reason not to post it, or a good reason you
+should not havbe been permitted to hear the tapes in the first place?

I agree with Mike, there is NO reason why we should not be allowed to hear what these announcements sound like. It can't be classified, the EBS system isn't actually a part of the DoD or similar agency. I'd bet thet it's just one of those stupid little management-policy games that these people are so fond of playing...as if they have the wisdom to dictate anything that might be in the best interests of the Public. Let's hear it!

Subject: Identify old radio?

My wife's great uncle is closing his home and moving into an apartment with his widowed sister; I have an opportunity to pick up a floor model Delco 3-band radio (don't know if it's currently working, but I bet the electrolytics are all shot!). Can anyone tell me anything about this from this meager discription:

DELCO R-1131, S/N 019293, "Delco Super Heterodyne Receiver," 3 bands (.55-1.610, ~1.7-~5.5, ~5.5-~18 MHz). Couldn't find a date on the S/N plaque on the back, might be one inside on the tube layout chart, but

it was too dusty and we were moving other stuff that weekend, so I
couldn't linger...but we're going back for a second load!

Thanks for any info.

About the EBS tapes...
     Thats what I was saying, I've Never heard them!!! (as the note explains). No one replied to me with what they said... so I cant tell ya either. I'm out-of-school tommrow, and am leaving... but I'll see if I cant sneak a listen this afternoon if I have time between packing and studying (Studying? Whats that!?) for finals.
     If anyone DOES mail me with the actual message, I'll post it, since everyone seems to be curious...

There is a group of hams in the EN93/FN02/03 area who will be active
during the 10 GHz Contest weekends, August 18-19 and September 15-16.

If you are near us, drop us a line and we'll try to hook up for some
interesting travelling and QSO attempts on these weekends.
If you hear any of us on 2M SSB give us a call and we'll chat about
skeds, or drop me a line here and we'll try to coordinate something.

Look for us when the higher band activity drops at night during the
VHF contest.

I received a letter from F6EZV this morning. The following is a condensed version of the contents:

The F6KSX group has mounted previous Dxpeditions for 432MHz EME to C30BVA and TK4EME. This year they will be operating from CU8EME in the Azores. (Locator HM49JN). Operation will be as follows:-

July 10-17 144MHz MS/ES/Tropo 144.025MHz 17el, 1kW, 0.4dB NF
July 12-17 432MHz EME 16x21el, 1kW, 0.3dB NF
July 18-22 144MHz EME/MS/ES/Tropo 144.025MHz 4x17el, 1.2kW, 0.3dB NF
July 10-22 HF VHF net 14.345MHz for skeds

They are looking for skeds. They would like to try for the 1st EU/NA contact by other than EME (i.e. E-skip, Meteor scatter or tropo.

Contact Alain Bironneau (F6EZV), 8, imp des Perdix, 94 210 La Varenne, France

The group will be F1EHN, F6CTW, F6EZV and F6HKA

For those not familar with the Azores, they are a group of islands about 1000 miles west of Lisbon. The distance to the closest point in NA (the eastern tip of Newfoundland) is about 1500 miles. The distance to the eastern seaboard of the USA is about 2000 miles (Maine) to 3000 miles (FL).

Please pass this info on to anyone with well equiped stations, especially to anyone in Newfoundland or Nova Scotia who might have a chance for a non EME contact.

I have an '89 Taurus. I haven't tried HF mobiling in it, but I have a 2M rig in it and I've found that the car radiates a lot of ignition noise. Does anyone have any suggestions for taming this?

Before the miss conception is taken as law on field day:

Under bonus points #8 of field day rules it clearly states that for packet radio rule 7C is waived!! Rule 7C states no repeater contacts. Therefore the no repeater rule is not in effect for the packet station during field day. The same rules were in effect last year with the result being contest policemen tell you that QSO's digipeated thru them were no good so stop it.
Repeaters on other modes are not allowed, PACKET is the exception!

Hmm.. The story I remember from the "old days" was that a technicial at the
NORAD HQ made a boo-boo, as the alert message to Radio Stations (at that time)
was by TELETYPE, and there were two pre-punched tapes (remember punch-tape?)
at his console, one "test", one "we're at war, let them know"... and one day,
he accidentally sent the REAL war tape instead of the test, with all the
right authenticators in it. As was noted before, most radio stations ignored
the message (on air, anyway) (makes you real sure of the local radio stn's
concern for your stress level, eh?), but a few did tell their listeners that
the war was on. Supposedly, subsiquently the system was changed to avoid
this happening again, thru more "human in loop" design.

My understanding from talking to a former radio station employee is that
there are/were two classes of stations (primary and secondary - my terms).

The secondary stations, in the event of an emergency, tuned to one of the
primary stations and rebroadcast it. The EBS equipment rack included
tone detection, etc. and a specially packaged AM radio (not mil-spec, though,
supposedly of lower quality than the cheapest auto AM radios).

Primary stations would supposedly have the tapes "telling you what to do",
as well as feeds from "official sources".

I think this is why there is divergent opionion in this discussion from
knowledgeable radio station people - the EBS implementation varied, depending
on what kind of station it was installed in.

The Alinco DR-570T and the DR-590T both use a single port for VHF and UHF
antenna connection. For what it's worth, I'm quite pleased with the 590T.

A couple of years ago I bought a Radio-Shack 24-hour digital clock with a *BIG* display.

Radio-Shack stopped selling this beast, but a local discount store is offering a remarkably similar clock that only provides 12-hour display. It turns out that they both use the same display, and electronics--namely the TMS3450 clock chip.

I tried to get information out of Texas Instruments on this chip, but they steadfastly refused to acknowledge its existence. The chips have the TI logo on them, and they use the TMS numbering scheme characteristic of TI.

Can anybody (TI, are you listening??) give me any information on this chip--I would like to modify the twelve-hour version of the clock to twenty-four. I almost have it, but I need some info about the chip.

I have a problem with birdies on my PRO-2004 and have seen this on other 2004's and 2005's but it's not listed in the birdie table.

They occur every 2MHz on the odd MHz at *.750 - that is, 453.750, 455.750 and so forth. I've checked high and low freqs and it seems to be everywhere so I guess it's getting into an internal mixer or something. Since 453.750 is a local police freqency this is a real problem.

Anyone know where this comes from and/or how to fix it? I'm not shy about minor scanner hacking.

We've been discussing this topic like we all know what we're talking about, but I know that's not true in my case... :-)

Anyway, how about some basic info? I know what a QSL card is, and understand hams exchanging them directly. But when we get into the infrastructure of all these extensions and enhancements that have been build up around this simple exchange, I really don't understand what the details are.

Just who is a "QSL Manager"? Who takes on such a job and why? Are they "appointed" by a foreign ham, and are there people clamoring to get these positions, or are they people who volunteer to experience drudgery and annoyance for the sake of a foreign ham who is a personal friend, or what? Is the usual thing that one person is a "QSL Manager" for many foreign hams, or is this a one-to-one thing normally? Are there "QSL Managers" outside the US, or is this something that is US-unique?

What is a "bureau"? Who runs it/them, and why? Does each country have one? Do they have any "official" status, like being registered with that country's FCC-equivalent?

When did this stuff start? Any history notes or comments?

Post responses, don't mail them; this should be of interest to all the people out there who post "how can I become a ham?" or similar new-guy type queries.

[Someone writing a comprehensive reply to this would have more than half the work done on the QSL article for CQ magazine that I mentioned in a posting a week or so ago... Hint, hint, nudge, nudge... :-)]

Announcement for Quincy, IL, and sister city Herford, West Germany, special event between June 25 and July 1:

To celebrate Quincy German Festival Days and the 50th anniversary of the Western Illinois Amateur Radio Club, members of the WIARC and the Herford ARC will operate club stations W9AWE and DK0HF (respectively) as well as their individual stations, June 25 through July 1. SSB operation will be on all bands 15 kHz above the bottom of the General class segment and the bottom of the 10 m Novice segment. CW will be 35 kHz above the bottom of the CW segment. Emphasis will be on the 20, 15, and 10 meter bands when these bands are open into Germany. For a certificate, QSL with a #10 SASE to WIARC, Box 3132, Quincy, IL 62301. A special sister city endorsement will be added to certificates for stations contacting both a Quincy and a Herford station.

Bureaus are set up to reduce postage costs for overseas QSL's. From looking
in the call book, most of them are run by some radio club; most likely
that countries equivalent of ARRL (who runs the US bureau). The idea
is that if you do a lot of DX, you can send a bunch of cards at once
with some money to ARRL. They put all the cards for Lower Slobovia
in one package and send it off. The Slobovian bureau then puts all the
cards for an individual ham into his SASE (or however they arrange it)
and send it to him. It is much cheaper to ship a box of cards by the
pound then to put a stamp on each one and mail it.

You have to be a member of ARRL to use their service for outgoing cards.
If you aren't in the ARRL, you should be able to mail direct to a foreign
bureau. The addresses are in the foreign callbook.

This is a bit more than I knew when I posted my question about bureaus.
The big thing I still need is the details of assuring that the return card
gets to me from ARRL. Where do I send my SASE or do they want money, etc?

There are hundreds and hundreds of them. I'd suggest you get an
ARRL Repeater Directory. If you can't buy one in your area, try to
get to a ham store as soon as you get to California.

>I'm told by some people who've been to these areas that there are
>a lot of closed repeaters and that it's very difficult to find
>many that are open to all users.

This isn't true on 2m here in Northern California! There are very few
closed 2m repeaters. And most of the "closed" 440 MHz systems only use
tone access because of intermod problems, not because of a desire to
exclude people. They mostly use a 100Hz tone.

>Also as most of my time will be spent in the Sacramento and
>San Francisco areas, I plan on doing a little shopping as well.
>I hope to trade in my ICOM micro 2AT on a 2SAT, and possibly
>pick up a couple of other goodies (good second hand if I can
>find it).
>So would anyone have any recommendations on Ham Stores in
>Sacramento particularly??

I'll leave the Sacramento answer to the folks over there, but here
in the Bay Area, you can try the Ham Radio Outlet stores in Alameda
and Burlingame and Quement Electronics in San Jose.

73,
Patty

The following two articles should answer most questions about
QSLing procedures:

Bill's Basics: Postal Rates, QSL Cards, and DX QSL Bureaus

_CQ_, September 1988

Novice Notes: Paper Tiger (With some basic information,
QSLing can be easy and fun)
QST, February 1989

>[Someone writing a comprehensive reply to this would have more than half the
>work done on the QSL article for CQ magazine that I mentioned in a posting
>a week or so ago... Hint, hint, nudge, nudge... :-)]

Not sure which article this refers to, but the one by Bill Welsh that I
just mentioned is rerun occasionally.

Greetings,

I recently purchased a Yeasu FT 470, along with various accessories, at the Rochester, NY Hamfest. This HT was purchased, primarily, for my wife's use. We are quite impressed with the quality, features, and price.

Anyhow, about the battery pack, I have not had occasion to attempt to open the NiCad packs, as they are brand new. We have a pair of FNB-17 packs which may not be constructed similarly to the FNB-12. However, the FBA-17 Alkaline Cell Pack appears to be of the same external construction as the FNB-17 NiCad packs. I would expect that they probably open in the same general manner. The NiCad packs may be cemented together, but that may be a minor complication.

The FBA-17 is opened by gently prying up the tab between the rails on top of the pack then seperating the two halves from the top. There is an interlocking hinge at the bottom of the pack. Reassembly consists of mating the interlocking parts at the bottom and swinging the two halves back together until the top latch snaps.

I suspect that the FNB-17 could be opened in the same manner. There is a label between the top rails which covers what appears to be the same sort of locking tab as on the FBA-17. The FNB-17 may be cemented, hopefully not ultrasonically welded, together. If they are, a thin XActo knife may be usefull to gently seperate the seam, but be careful not to destroy the interlocking hinge at the bottom.

Hope the wordy information helps. I would recommend that the entior battery insert be replaced with one from a reputable supplier. The replacement of individual cells may appear to be financially prudent in the short term, but will probably result in the necessity to reenter the pack numerous times as the other cells die and the capacity will not be as great as with a new set of matched cells. Enough rambling!

Good Luck, 73,
Joel, N2EZV

]
I can tell you where it comes from, but not how to fix it. You have
a strong signal coming in from a UHF station (I think channel 21). This
signal mixes with the 2nd LO. When the second LO is tuned to *.750,
the mix gets into the 2nd IF.

From memory, the frequencies involved are:
  1st IF 610-612 MHz (or was it 608-610). LO about 75 MHz lower.
TV station 75 MHz lower than that (you are hearing the audio subcarrier
of the TV which is always at a *.750 frequency).

I have the same problem, and am locate 15 miles from the UHF station.

    Here's a brief note about converting those 12 H LED clocks to 24 H. I
    was going to buy a Radio Shack 24Hr clock untill I noticed a local
    discount store had the exact same clock (less the 24/12Hr switch) for
    about $5. It didn't take too long to figure out the little solder pads
    for the options (12/24Hr and 50/60 Hz). Lo and behold, when I turned it
    on I discovered that the LED display had only enough segments for 18:88.
    They actually left the other led's off the display module! It does still
    work, though.

I have obtained an FM CB radio at recent hamfest. It covers 26-28 Mhz in 40 channel steps, is powered by 240v. 50hz, and outputs about 4 watts of frequency modulated carrier. I intend to convert it to cover frequencies on or around 29.6 Mhz. It uses the Motorola MC145106 PLL chip.
The seller said it was a CB radio from England. Is this correct? Besides the wider band coverage, the FM aspect intrigues me. I wish it was this way in the U.S. Instead of all the heterodynes, imagine how peaceful a "silent pileup" might be.

>

Well, to be adventuresome, I tried the "light-B-#" on my IC-2SAT.
I didn't get wide-range receive coverage, but I did get ALL the
LCD segments to turn on right after I powered the rig up.
None of the other key combinations that NM1D noted seemed to have
any effect.

So, are the digital processors the same? Can these "software"
changes be applied to other Icom handhelds? Has anyone found
useful key combinations?

>Radio-Shack stopped selling this beast, but a local discount

It might interest you to know that radio shack DOES still have such
a clock available - the model number is 63-805B. It has switch selectable
24 time, a battery backup (it is 110volt powered), and 1.8" red
LED's. I know - I just bought one today. Cost was very reasonable,
about $22.

This is not just an old one either, because the manual in the box
has a 1989 date on it. I suggest that you go back to your local shack
and holler....although I don't know if Canadian shacks sell different
stuff. I think you said you were from Canada, right? If so, perhaps
a trip across the border would be well advised.

While the FD rules don't allow voice repeater QSOs, they specifically
allow DIGIPEATED QSOs. I assume that this includes THEnet and Net/ROM
repeated contacts.

As FM gets narrower and narrower, the stronger station has to be stronger
and stronger to capture the receiver. At some point it cannot be done.
While FM with the deviation we use is certainly better than AM, it also
comes from a tradeoff of bandwidth.

Hello all,
I had this feeling that today would be the day, so I ran home at lunch
and, sure enough, my new Tech ticket was in the mailbox. Back at work, I
showed my boss (not a ham but a comic) and he stared at it awhile and said,

"Oh, no lazier than you, huh?"

My new call is N0LZR

I guess someone will soon be a N0MAD (nomad)

I been going around and around with Pacific Telephone with a nebulous "low audio level" problem and have'nt got it fixed yet in 3 attempts over the last few months.

I have a repeater autopatch and personal phone lines comming into my residence. Both lines are sitting at 17-22 volts on-hook and 4.4-4.6 volts off-hook using a Western Electric model 2500D telephone set (standard TT desk phone). My understanding of the phone system is limitted but I would expect to have 45-51 volts at the service block. I called the 611 repair to complain about this low audio problem. The rep called back and told me that I have a short on my inside wiring. So I removed the modular plug from the service block (this removes the inside wiring form the incomming service line) and took my 2500D set outside to the service block and made the following measurements:

line 1: off-hook 4.33 volts @ 23.7 mA = .1026 watts

line 2: off-hook 4.28 volts @ 23.9 mA = .1023 watts

I checked the on-hook voltage at a neighbors residence and it was 46.3 volts. I called a friend in a distant community and he had 51.2 volts/51.5 volts and 10.6 volts/10.6 volts on his 2 lines on-hook/off-hook. These 3 lines appear to be normal.

The service rep response to this voltage comparison was that "the company doesn't gaurantee the line voltage. I said that some of my jap track phones (line powered) won't dial and decode properly on my lines but work fine at other residences. She said that she would have a tech respond but that it would cost $35 min if the fault were mine. I said that the situation was unacceptable and send 'em out.

Well, a few hours later, my wife gets a call from a different person saying that the problem was a faultly splice. That everything was fine now. No one ever came to our house. As I had left for work, I heard about this later. I rechecked the 2 lines again, both were still at 22 volts. It appears that the bad splice (singular) had no effect and the audio on both lines is still poor.

The (unknown) rep called the following day and left a msg on the recorder asking if our phone was OK now. Did'nt leave a name/number. So problem is not resolved.

Any thoughts or hints on how to prod a big baby bell into some real service?

To all who took the time to reply to my request for information
on repeaters Northern Cal., a million thanks. I was swamped with
replys on repeaters, and advice on Ham Radio Stores in the
area. There was a lot of advice and information given which
seemed to be common to almost all who replied.
The one thing I will miss while I'm in California in the
monthly flea market. I'll be in L-A at that time. However, on
the other side of the coin I will be in the Disneyland area
during their special On-Air event commemorating the 35th
anniversary.
Again many tnx for the info, and C U on 2 in June and July.
73,

Well, they're 95 cents here in Tulsa, so maybe its really your post office that is confused. Unfortunately, an airmail reply from most countries takes 2, 3 or even 4 irc's. There is a table in the Callbook with this information. Since a greenstamp appears to be convertible to first class airmail postage *almost* everywhere, that's what I use. In some countries though, its illegal for the residents to have foreign currency. To be on the safe side, I check the 'Greenstamp Guide' published by DX QSL Associates first. It lists countries where greenstamps are ok. DX QSL Associates also sells 'European' airmail envelopes and foreign stamps. The prices seem a little high, but you don't need a big supply of either. I've been having very good returns on Soviet QSL's using the appropriate stamps, with some cards coming in only 30 days after the QSO. I don't stock up on stamps though - postal rates change more often in some parts of the world. I recently received a card from Cyprus and the op had added stamps beside mine. Fortunately, I had included a 'cheap' irc as well - I *really* needed a 5B card ;-) Rarely, a country is is not listed in either the Callbook irc table or the 'guide' (9Y Trinidad comes to mind). In that case, I stick to ircs.

I have a low door and have two glass mounts on the back window of my Subaru wagon. The 2M element is mounted at the bottom of the back window, which is slanted, so the element stands away from the glass, completely vertical. The Larsen whips are pretty flexible and take a lot of abuse. SWR is less than 2:1 although the 2 whips affect each other. I regulary hear the tips of the whip scraping on my garage door as I drive under it. I get about a year life out of the whip, although I haven't worn one out yet, just done something stupid instead.

I'm looking for a receiver with the following specs. If they seem a little unusual, it's because it's not for communication, but rather used in connection with magnetic resonance experiments.

  Frequency coverage 100-1000MHz (continuous, not channelized)
  Bandwidth adjustable from 500Hz to 50kHz (can be in steps)
  Must have bfo (signals are akin to cw transmissions)
  Sensitivity of 0.5uV
  Ability to withstand 1000V pulses on input without blocking or damage.
  The receiver will operate in an environment of very high EMI including huge pulsed magnetic fields.

If nothing like this exists on the market I will design and build one, but I'd prefer to buy.

Please, does someone have the model number for the mobile charger/power suply for the Yaesu FT-208/R, 2 Meter handheld transceiver? Mine was stolen from last week. I am trying to locate another one and don't even know what to ask for.

Incidentally, if you have one which you'd like to sell, please contact
me.

Thanks

[NOTE: Message modified, SYLVAN KATZ, 08 Jun 90 10:35:14]
Does anyone know if the teletype station that has been continuously
transmitting at 14.024 MHz is a commercial station. From this QTH
the signal seems to come from over the pole (beam heading a little
west of north). I can hear the transmission 24 hours a day and the
signal is S9 at this location even when there are no openings to
europe. My QTH is about 250 miles north of the North Dakota/Canada
border.

Subject: TM-731A RPTR & OUT-OF-BAND MODS
Path: N8HTG!VE3WZL

Thanks to the efforts of our local technical wizard, Bob VE3GVD, we now have the secret to making the new Kenwood TM-731A do the same fancy tricks that its sister rig the TM-721A did. Here is how it's done:

1) Remove the top and bottom covers, and take out the screws that will allow the front panel assembly to swing down.

2) With the rigs front facing you and the top side up, locate R 121 and R 125 which are both immediately to the left of the lithium battery.

3) Using a low wattage iron and tweezers, remove R 121 which is about the seven o'clock position with respect to the battery and reinstall it in the blank position designated for R 125 which is about the eight-thirty position with respect to the battery.

4) Now locate R 25 on the back of the circuit board that is attached vertically to the main chassis. (It's the board behind the front panel when the panel is folded up) Carefully un-solder and lift off the grounded end.

That completes the mod. Having a service manual, or at least a board layout will assist you in locating the components. It will be neccessary to do a reset on the microprocessor as described in the user manual after doing the mods described.

For those curious as to what does what, removing R 121 enables the repeater cross-band function, and the adding of R 125/removal of R 25 enables the out-of-band features.

Hi gang!
     I am looking for a couple of manuals for some equipment that I own:

     1) Systron Donner 6057 Microwave Freq. Counter.
     2) Systron Donner 7244A System DVM
     3) Dana 6900 Digital Multimeter.

If anybody has a copy of any of these manuals that I can borrow/buy, please
let me know.

     Thanx,
          Chuck Harris - WA3UQV
          chuck@eng.umd.edu
          (301)490-7443

> if you know the announcemnt ahead of time! I asked some more authoritative
> people at the station if i could listen to one of the "carts" in an isolated
> room sometime and was told "No.".

Never never never ask first. They will ALWAYS just say "NO" when there is any doubt whatsoever, and there always is some. Just go ahead and do it and ask for forgiveness later.

[BTW, this also applies to asking they FCC if "it" is illegal]

> Does anyone out there know what these say? If so could you email me
> what is says, or is that illegal somehow?? WHATEVER YOU DO... Dont reply with
> the actual message to the net!!!!!

Sure, go ahead and post it after you listen to it, unless the cart begins with a COPYRIGHT NOTICE :-)   I doubt if it is copyrighted, so feel free to make duplicates and all that.

There are in fact networks of repeaters linked together. He may have been operating through such a network. Also, the new dual-band radios have a repeater feature that allows cross-band repeater (fun to try, boring after a while).

FT736 & 9600 Baud Operation

by James Miller G3RUH

These notes tell you where to get FM RX audio direct from the discriminator, and where to modulate the FM TX varactor directly. These mods are non-destructive and take no more than a few minutes. The signals bypass the "DATA SOCKET" for high grade FM operations.

The RX mod is suitable for:

- UOSAT-D 9600 baud downlink and terrestrial links
- 1200 baud AFSK/FM Standard Packet - BUT IT'S UNSQUELCHED.

The TX mod is suitable for:

- FO-20/PACSAT uplink (1200 bps Manchester FM)
- UOSAT-D 9600 baud uplink direct FSK and terrestrial links
- 1200 baud AFSK/FM Standard Packet.

---*****---

FT736 - FM Direct from Discriminator

Detected FM direct from the receiver discriminator is available from the RX UNIT at the junction of R91 and C83. These components are shown in the top right-hand corner of the schematic.

Proceed thus:

1. Disconnect FT736 from the mains electricity. (Safety).
2. Remove top cover only.
3. RX Unit is the vertical module on the left.
4. Locate R91 which is about 25mm from the top, 50mm from the radio rear. the resistor is "on-end", and near a couple of glass diodes.
5. Scrape any paint off R91's free end and wet with solder.
6. Your RXaudio lead should be a fine screened cable; connect the inner to R91, and the outer braid to a ground point (e.g. can of TO09)
7. Route the cable out though any convenient aperture in the case.
8. The discriminator sensitivity (FM Normal) as about 6 kHz/volt.

Important note on 9600 Baud Use

Most FT736 receivers are fitted with an LFH12-S IF filter for FM. (CF01 at the top front of the RX Unit). This is a 12 kHz bandwidth filter which is a little narrow for 9600 bps FSK operation. It is recommended you change this to 15 kHz or better still for UOSAT-D use, 20 kHz bandwidth which will allow more tolerance for doppler shift, and give a far better "eye". Suitable filters are: LFH-15S or CFW455E, and LFH-20S or CFW455D. The first of these is a Yaesu spare part, and is often already fitted. Try the standard first and see what happens; these filters have moderate part to part variations.

---***---

FT736 DIRECT VARACTOR FM MODULATION

Refer to the circuit diagram; inject your TXaudio at the junction of R32/C29 on the TX Unit. The signal level at this point should be 800 mV peak-peak, and will give +/- 3 kHz deviation. DO NOT EXCEED THIS LEVEL. Set Mic Gain to min.

Modulating the FM transmitter this way you get an LF response down to 18 Hz (at which point the associated synthesiser PLL begins to track the modulation), and an HF response which is flat to some 10 kHz.

Proceed thus:

1. Disconnect FT736 from the mains electricity. (Safety).
2. Remove top cover only.
3. TX Unit is the module flat on the left (not the one tucked down the side vertically).
4. R32 is just to the left of the rectangular shielded enclosure. The resistor is "on end". Scrape any paint off the free leg.
5. Your TXaudio lead should be a fine screened cable; connect the inner to R32, and the outer braid to the adjacent enclosure.
6. Route the cable out though any convenient aperture in the case.

```
 7a. 1200 BAUD G3RUH PSK MODEM: TXAudio of 800 mV pk-pk can be obtained by
     adjusting the components C9= 1uf, R3=47k, R5=infinity (i.e. remove).
     C10 stays at 10nf (0.01uf).

 7b. 9600 BAUD FSK MODEM: Adjust TXAudio level with VR1

 Notes compiled by G3RUH @ GB7SPV 1990 Mar 16

It has been reported that an alien vessel has landed near Hamtramck, MI. This event closely followed the mysterious disappearance of all orbiting AMSAT satellites. Pointing smoking lasers at the population, the aliens demanded to know the way to the satellite launch site, and said that, due to a malfunction in their ILS, they missed their PIL by "a few hundred" miles.

Oh, heck! I wasn't supposed to post this to the net.......

:)

I am planning to install a tower and have interest in the Aluma Tower T-40H from the Aluma Tower Company in Vero Beach,Fl. There are no local dealers where I can go "kick the tires" so I would appreciate comments from owners of these towers. Comments on quality, installation problems, permit problems, any problems on weathering, problems on raising/lowering the tower, would you buy again, how long you have had the tower, and the like, both pro and con, would be appreciated. In the area of installation and permits, comments on what you would do different next time would also be appreciated. Also if you have owned other towers and have comparision comments I would appreciate these.

I received this in the mail so I am posting it to the net.

x---- cut -----x

CROSS BAND REPEATER MOD

To operate the TS790A in the repeater cross band mode,diode D32 on the control board must be opened.In addition,two resistors must be soldered to a 13 pin din plug which will be connected to the ACC. 2 jack on the back panel of the transceiver.

TO LOCATE AND OPEN D32

1 Disconnect the power supply and antenna from the radio.

2 Remove the 14 screws that secure the top and bottom covers.

3 Carefully remove the top and bottom covers.

4 Locate the control board. this is a vertically mounted board that is positioned approximately 1 inch behind the front panel.

5 Locate diode d32 towards the top right side of the board.

6 Using a small pair of wire cutters,cut the lead of the diode. do not pull on the lead or the diode as this may tear the foil on the other side of the board.

7 assemble the radio by reversing steps 1-3.

13 PIN DIN PLUG CONFIGURATION.

1 Using a small flat blade screwdriver,lift up on the tab of the nylon cover.

2 Once the tab clears the slot of the metal holder,pull the cover off the plug.

3 Carefully separate the two metal holders and remove the pin assembly.

4 First tin pins 1,8 and 11 of the assembly so the resistors can easily be soldered in place.

5 SOLDER A 100K ohm,1/4 watt resistor between pins 1 and 11 of the assembly (the resistor leads should be cut and shaped before soldering).

6 Solder a 1.5K ohm,1/4 watt resistor between pin 8 and the lead of the 100K ohm resistor that is attached to pin 11.(the resistor leads should be cut and shaped before soldering)

7 Wrap a small piece of electrical tape around the resistors.This will insulate them from the metal holder after the plug is assembled.

8 Mount the pin assembly in the two metal holders.

9 Slide the cover over the plug until the tab engages in the slot. The "U" shaped strain relief will not be used.

10 Plug the 13 pin din plug in the ACC2 jack on the back panel of the radio.

OPERATING PROCEDURES

The repeater cross band operation allows the TS790A to receive on one band and re-transmit the signal on the other band. Incoming signals will automatically be switched to the sub band.The TS790A will then re-transmit the signals from the main band. Each band may contain offset and sub-audible tone information (an optional TSU-5 must be installed in EACH BAND for decode).

1 Press the MAIN function swich to select the MAIN band.

2 Select the first operating frequency and mode (fm only).Select the offset as required.

3 If the CH.Q is on,press the CH.Q switch to turn the function off.

4 Select the sub-audible tone as required .

5 Transfer the contents of the MAIN band to the SUB band.

6 Select the second operating frequency anf mode (FM ONLY) and turn the CH.Q off.

7 Select the offset and sub-audible tone as required.

8 Adjust the MAIN and SUB band squelch controls to the threshold point.The TS790A will transmit in the repeater crossband mode if the squelch controls are set too low or a signal is received.

9 Adjust the power control to allow normal output power from the MAIN band.

10 Adjust the sub band volume control to a normal listening level to monitor incoming signals.

11 To place the radio in the repeater cross-band mode,press the F. switch and then press the M.IN switch. An asterisk will light in the MAIN band display for confirmation.

12 To cancel the operation,repeat step 11 and disconnect the DIN plug.

13. If the DIN plug is left in place after use,bleedover from the SUB band audio if present will be mixed with any transmitted audio. This will make your audio during a conversation hard to understand.

TSU-5 TONE UNIT

When the TSU-5 tone units are not installed,only the tone (encode) function can be used.
If CTCSS is to be used it must be installed in both bands to function with the cross-band repeater mode.

TX AUDIO ADJUSTMENT

The audio gain can be adjusted by variable resistor VR36 on the IF unit.

If the range of VR36 does not suffice for normal transmit audio,the values of the resistors on the 13 pin din plug can be changed.
as an example,if the audio is too low,reduce the value of the 100K ohm resistor and increase the value of the 1.5K ohm resistor.

TO ACCESS VR36

1 Remove the bottom cover of the radio to expose the IF unit.

2 locate VR36

3 Use a plastic alignment tool to adjust VR36 for normal TX audio.

4 After the audio is adjusted,install the bottom cover.

73 AND HAPPY MODING

x----- cut ------x

EXTENDED FREQUENCY RX AND TX OF THE ALR22T & ALR22HT
ALINCO 2 METER RADIOS.

BEWARE OF ANY STATIC WHEN WORKING WITH THIS RADIO !!!

1 Remove the top and bottom covers of the radio.

2 Remove the 4 screws that hold the front panel assembly to the main chassis.

3 Pull front panel away from the main chassis very gently.

4 Locate the Volume\Squelch pot on the left side of the radio.

5 Locate the VFO control on the left side of the radio.

6 Between the two above units is an IC that runs vertically between the two units. (ONLY THE 12 PINS OF THE IC ARE SEEN FROM THE BACK)

7 After locating the IC locate 3 sets of unsoldered jumper pads between the IC pins.

8 Make a solder bridge between the top 2 pads,then the middle 2 pads,then between the bottom 2 ONLY of the bottom set of 3 pads.

REAR VIEW OF FRONT PANEL

```
    / ------\  12 PIN   O  *  O                        /---------\
   / VOLUME  \  IC ->      |<-SOLDER BRIDGE           /           \
  / CONTROL   \         O  *  O                      /             \
 /             \                                    /     VFO       \
 \             /        O  *  O                      \  CONTROL     /
   \         /             |<-SOLDER BRIDGE           \           /
     \-----/            O  *  O                        \--------/

                        O  *  O
                           *  DO NOT SOLDER THE TOP PAD
                        O  |< O   OF THESE 3 PADS
                           * \SOLDER BRIDGE HERE
```

9 RE-ASSEMBLE RADIO .

10 RESET MICROPROCESSOR.

11 This mod will extend the RX range as well as the TX range of the above unit.The display will have a range   from 29mhz to 299 mhz but this is

just an erroneos display as the PLL on a typical radio will rx between
130 mhz and 180mhz with a TX range that may be a little beyond these
these frequencies.

GOOD LUCK AND HAPPY MODING

> June 1.)

That thursday evening around midnight driving home from work I tuned in the Miami National Weather Service on 162.55 Mhz. Only to find it was being wiped out by the NWS from Melbourne, FL over 150 miles to the North. This is usually a good reliable indicator of some kind of opening. This has happened several times in the past. Thats when I scan the bands looking for distant repeaters.

On the night of May 31, I was able to monitor the following from my Gary, IN location:

Various fire calls in south central Pennsylvania (33.6-34.0 MHz)
An 6m FM repeater in Wichita, Kansas (I think it was 29.66 MHz)
KVOU-TV Channel 4 (FOX) in Billings, Montana.

Whenever a band opening such as this comes about, I tune my tv to WBBM Channel 2 in Chicago to determine the "severity" of the band opening. Sometimes the interference in the picture is such that it becomes unintelligible. I have seen stations in Connecticut, Texas, Montana, and Quebec (including a French version of Wheel of Fortune!) during such band openings. Last June (appropiately enough on Field Day :)), there was a E opening and a tropospheric opening at the same time, and lasted almost the entire weekend. I was able to record an FM broadcast in French around 92 Mhz. I could not get the call sign, but I am unaware of any local French language broadcasts.

Why not?? Is the stuff copyrighted? Top Secret? Or is it like the
Monty Python World's Funniest Joke, that will cause instant death to
all listeners from overlaughter?

Seriously, is there a good reason not to post it, or a good reason you
should not havbe been permitted to hear the tapes in the first place?

I have first seen the FIN (can you say shark) type antennas on airplanes
a few years back. I'm pretty sure the antenna specialists make some for
150 & 450 bands. I have seen then around here on school buses (151.XXX)
and other vehicles. They are usually white and I thisn that they're
about 2 inches wide 7or8 inches long and maybe 5 inches (440<3) high.
Sorry I don't have my catalog(s) handy, but if there's interest I'll
look it up. IS Anyone using these antennas?.

Is anyone aware of software that will emulate a TNC?

The reason I'm asking is that I have computer (VAXStation-3100) and a 2400 Modem. I've been considering the purchase of a TNC (MFJ-1278), however it is about a $280 investment.

I would like to test the whole idea of TNC (i.e. CW, RTTY, Packet, etc.) without investing a lot of mony up front.

The second part of the above "project" is getting the signal amplified from the radio output level (mv?) to modem-input level (24-48 volts). I was planing on building a simple audio amp (with good freq-response).

Any suggestions from the TNC-qeru's?

While I own two FNB-12s, I haven't had to open them yet. But that day will come. They don't look as hard to do as some of the plastic puzzles I have tackled. The worst one was a battery pack for the STS AV7600 aircraft handheld. It had a L-joint on the top and a neat job was not to be had, but results were usable.
I use various small sharp things like an industrial razor blade, jewelers screwdrivers, hammer and cold chisel, and whatever else it takes to split the seam. I used to have an Ungar soldering iron tip that had an Xacto blade on it, but I haven't had to resort to that yet. This tip was great

for making doors that open on model cars, but I haven't seen it since 1966. Persistance is the word, and I absolutely will not pay $50 to $70 for a new battery pack when all that is wrong in there is usually one bad cell. About 12 volts across its butt for a moment sometimes gives it a new lease on life, but my experience doing this is about 50% success. If you try this, only zap the shorted cell, not the whole pack. Good luck and good cracking.

I requested and received one of the blue and white Extra class diplomas about 1980 from my local FCC office in New York.   With all the budget cuts the FCC has had I doubt that they're still available.

I used to be the supervisor of the NOAA Weather Radio unit at the NWS office
in the OKC/Norman area.  That message (from memory!) says, "The United States
Government has declared that a Nuclear Attack is imminent(sp?).  You are
directed to tune to your local Emergency Broadcast Station for safety
information."  Or some such nonsense.

Procedure was: tone alert it.  Do it live while recording and leave it as
the only one running on the console.

Off the record, most of my employees said that if it were the real thing, they
would append .."and stick your head between your legs and kiss your a..
goodbye."  I would've problably done it too.

As I mentioned in an article a few weeks ago I ordered the new AOR AR-1000 handheld scanner from Grove Enterprises. I had been looking at the ICOM R-1 intending it as a replacement for my old Bearcat 100XLT, but the R1 is either a short or a long way off depending on the phase of the moon. Several people have posted or mailed asking for a report on how the scanner performs, so here is my review.

* * * * *

DISCLAIMER: These are my opinions. I am not an engineer, just a scanning fan. I do not work for any of the companies mentioned below, nor will I gain any compensation for this report.

* * * * *

AOR AR-1000 Handheld Wide Range Communications Monitor

o Frequency range: 8-600, 805-1300 Mhz (minus TV)
o Scan/search/manual tuning
o 1000 non-volatile memories, 10 banks of 100 channels/bank
o Scan rate: 20 memories/sec
o Tuning steps: 5 to 995 kHz, divisible by 5 or 12.5
o Receiving modes: AM, NFM, WFM
o Sensitivity: 0.35 uV NFM, 1 uV AM/WFM
o Search: 40 increments/sec
o Features: delay/hold, squelch, priority on any channel, 10 db selectable attenuator, 4 AA nicads (13.6 VDC), 12 oz weight, 2.5"W x 6.84"H x 1.75"D, AC wall charger/adapter, carrying case, belt clip, cigarette lighter adapter
o Price: $499, Grove has for $459

First (open box) impressions:

The case looks much better than the Uniden cases. There is a removable metal belt clip poking through from the back of the scanner and a clear plastic shield over the keys. The whip antenna looks like one of the Larsens. The weight and feel are JUST right, unlike the heavy and tiring

Bearcat. The manual tuning knob on the top seems a bit too long for the unit; it rotates left/right to decrement/increment the frequency by the desired step. Squelch and volume are a single knob on the top; the squelch is the outside jacket of the volume. The local/DX switch is also on top.

The keypad looks nice, and so does the display. The light is a little wimpy, though. Four(4) AA nicads supply power to the unit, no more hunting for odd battery packs.

Operation:

Here we go. It took about 1 hour to master the Bearcat; it took 3 _DAYS_ to learn the AOR. Their manual didn't help matters. It looks like something an engineer knocked out (no offense intended). It is a piece of junk. Things are cut-and-pasted into a mess, there are two(2) sections on scan limiting that are identical, and there are general errors. But the manual is vital in order to learn the unit. It's like flying the shuttle. Take entering bank numbers to scan for example:

- Bearcat: hit <SCAN>, then the bank number. For multiple banks press their numbers. The numbers are toggles (on/off).
- AOR: hit <SCAN>, <BANK>, <PROG>, <LIMIT>, lower bank limit, <LIMIT>, upper bank limit, <ENTER>.

Searching is MUCH worse.

Gripe: if I wanted to scan banks 1 and 5, I can't. I'd have to scan banks 1 THROUGH 5. Trying to lock and unlock banks is also a pain. I accidentally locked out all the banks, and it took 2 hours of unlocking every channel to get the scanner back.

Scanning:

Performance rolls off below 30 Mhz and above 1200 Mhz. As a shortwave receiver I don't put much stock in the AOR. It didn't do well. I was able to copy a few stations but they faded in and out. OK, so I didn't hook it up to an active antenna or a longwire. I only used the whip and a shortwire. But I barely picked up anything under 30 Mhz even under good conditions.

UHF, particularly ~460 Mhz (local police): does OK. Some birdies and false detections around here (400 to 600 Mhz), but all-in-all just as good as the Bearcat. Couldn't test the 200 Mhz region since we don't have any close military installations, and I couldn't get any drug/FBI/Secret Service/gov't stuff.

Aircraft bands (108-136 Mhz): here I had a problem. Even sitting at the end of the runway I could not pick up traffic as well as the Bearcat. The transmissions were garbled and faint. The AOR apparently has problems with this region.

Cellular? Of course I didn't listen, so I can't say (ahem). I imagine, though, that it would do as well as can be expected (cough). The upper reaches (900+ Mhz) went untested as I never could hear anything.

Conclusion:

It went back to Grove 12 days after receipt. I got tired of fighting it and constantly being reminded of its shortcomings. And I really wanted shortwave, where it showed its worst performance. Perhaps a real shortwave antenna would have helped. As far as the other bands were concerned I used the unit with the supplied whip and with a Radio Shack discone antenna (25-1300 Mhz). Reception improved, but so did the false reports (it locked more noise as a station). Rejection was not too good.

Also, it seemed that every time I turned the unit on I had to re-adjust the squelch, even if I had not moved it. Another thing: it picks up harmonics VERY well. One of our local stations on 89.7 Mhz FM came through on our local NWS weather channel (162.55 Mhz), down to about 50 Mhz, and all the way up to 200 Mhz in good conditions. Admittedly this is their problem, but the AOR didn't make it its problem.

In short, I was disappointed. Looking back I have to realize that AOR was trying to cram quite a lot into such a small package and that I should not have set my hopes too high (an ICOM R-9000 in a handheld). But I still feel that a separate shortwave and scanner are the way to go with the current market situation. I continue to await the ICOM R1, and will make a road trip to see and test it. But I'm going to be happy with my new Bearcat 200XLT until then.

This may, however, be the scanner for you. I will not go onto the record as opposed to the AOR; it simply wasn't what I wanted. You should try one out before you buy it or any other.

If anyone has any specific questions or discussion I'll be happy to answer them as best I can without the unit. Just drop me some mail.

Hello,

I am looking for a mobile dual-bander (2m/70cm) rig for the car. My problem is this, nowhere in the ads do they mention whether they have single or dual antenna ports. I would like one with seperate ports for the antennae. The units in question are;

Kenwood TM-731A, Icom IC-2400, Alinco DR-570T and DR-590T. I have already eliminated the Kenwood TM-701 as a single porter. I know the Yaesu 4700RH has two, but would like more memories. Any help appreciated.

What does deregulation have to do with it? The old FCC 3rd class license didn't particularly require brains, you know. Besides, when you are the sole operator of a station, for hours at a time, you're bound to make some mistakes. Blame the station manager (or Chief Engineer) for putting the tapes where they could be confused with the test tapes. This stuff was happening in the late 50's and 60's, when we were still regulated.

This can't be Sporadic E because the station you heard is only 150 miles away but tropo-opening.

SB RTTYDX @ RTTYDX $RTDX0106
RTTY DX Notes, 1of3, 6/1/90

RTTY DX Notes for Weekending 1st June 1990.
Part 1 of 3.
BID: $RTDX0106

If this week's DX notes appear a little sparse, I must apologize, as I can only report what information I receive. This week there has been very little activity, or maybe everyone was chasing the Yemen station. Conditions of course were not the best for most of the week, and that did not help either. So all that I can say is that we are not up to our usual standard this week. We will try harder next week in the ANARTS contest.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JA1BLV, OD5NG, TG9VT, VK2EG, VU2DPG, and W0LHS. Thanks chaps for the news and DX in your areas. It all helps a lot.

SB RTTYDX @ RTTYDX $RTDX0306
RTTY DX Notes, 3of3, 6/1/90

RTTY DX Notes for Weekending 1st June 1990.
Part 3 of 3.
BID: $RTDX0306

Lord Howe Island. VK9LI will be active from June 7th until approximately June 13th, especially during the ANARTS RTTY Contest from June 9th to 11th. He will operate RTTY only, maybe some AMTOR. Due to the sudden rise in costs, small donations would be appreciated.

Chafartnas Island, AN9CI. EA9JV will be qrv from June 14th for one week. This is good for IOTA and prefix hunters awards.

Yemen, 7O1AA. Beware. There are pirates using this call. Make sure that you work the right one. They are only on SSB at the moment and for the next nine days.

Marion Island. ZS8MI has a new operator. He may turn up on RTTY, who knows?

VQ9ZZ. He is active again. The last time we saw this call he was onboard ship in the harbor, and using commercial gear. Hence he

cannot use the four letter selcal, so that is why he is on FEC Only.
Maybe it is the same operator, and not being on land it does not count
as a legitimate VQ9 operation.

Everyone is smiling. They have received their JT0DX cards. It pays
to wait and wait at times.

See you in the ANARTS contest on 9th June 0000Z until 11th June 0000Z.

For VK9LI QSL card and donations send via VK2SG.

Sorry for the brief notes, chaps. Hope for better things next week.

GL DE DX1 (VK2SG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips
to VK2SG @ VK2AGE.AUS.AU.

I've written a quick-and-dirty computer-based logbook to keep track of stations contacted/heard. I'll post it to the group if I receive more than 5 requests for it.

It uses the MS-DOS sort routine, and I've only tested the program with MS-DOS v3.3.

This program requires beta testing. It's freeware. You're welcome to use it, and if you think someone else would like to try it, pass it on.

I desperately need these four 73 magazines. I would be willing to photocopy what I need and return them at my expense, reimbursing any postal costs. Will someone please help me? Please email.

The four needed 73 mags (ALL 1989, last year)... April, June, Aug., Nov.
Thanks.

>   appreciated.

The Icom IC-2400 is a dual antenna port radio. The IC-3210 uses one port
but it is on sale right now while dealers try to unload their stock. The
difference is greater than the cost of an external VHF-UHF duplexor.

The IC-2400 has 20 memories. I believe it might even be possible to save
20 VHF and 20 UHF frequencies with offsets, but I am not sure.

Icom also has a matching UHF/UHF dual band, the IC-2500, with 70cm and 23cm.

  I don't have a Caravan, but I do have a Jeep Cherokee and a similar
  problem. I ended up using a Larson 1/4 wave with the L-shaped
  mounting bracket that is designed to attache between the trunk lid
  and fender of a sedan using sheet
  metal screws. I mounted this antenna at the top of the hatchback.
  The antenna doesn't quite miss the open garage door (by about 1.5 inches)
  but its good enough to enter and exit without problems. It ends up
  being a pretty good low profile antenna.

I have used the MFJ 1270B TNC for a while now and find that it
has very few operating problems. I have heard of a few people who
had diodes go bad on them, but it is not the majority of the users,
and anyway, these were older models.... I do recomend the 1270B....

I played one of these tapes at a non-commercial station in the 1960s. The reference to nuke war must have been a joke. These are generic tapes for any emergency (tornado, hurricane, civil unrest) and simply direct listeners to tune to the EBS station serving their community.

Any implication that these are only for nuclear conflict are the result of someone's fantasy and cold war hysteria.

Uh-uh. Were POTUS (the Prez) to take a non-military aircraft, ID would be "Executive One". Helicopters are usually USMC, and ID "Nighthawk #" until the Prez boards, then it's "Marine One". Perhaps a USAF helo would be AF-1 for the trip.

And if you install the TAPR XR2211-DCD modification, for $11, you'll be able to run with your radio's squelch open, which means the other guy can cut his TXD in half or better, which means that EVERYONE on the channel will enjoy increased throughput and fewer collisions.

Takes about 15 minutes to install, assuming you know how to solder.

I've a question regarding a Yaesu FT-101EE HF rig. Essentially, what should the microphone impedance be?

When I purchased the rig a few days ago, I got a Yaesu four-pin hand-mike with it. I'm not sure if this is working properly. Here we go:

Here is supposed to happen: you key up the mic and start talking into it. The ALC needle starts at full scale with no modulation, and you advance the mic gain until voice peaks are causing the needle to dip about halfway through the green region on the meter. This translates to the needle dipping to roughly 2/3 of full-scale.

What happens: at full mic gain, the ALC hardly even moves. Yelling/whistling into the mic will obtain some deflection. However, I had a QSO with two friends last night on 10m and I had to drop the mic gain to "2" to be intelligible. At this level, neither the Power Out nor the ALC indicators moved. The Drake matching network also didn't indicate any output power. The two friends were about 1 mile and 15 miles away and were getting S9 signals.

Before I purchased the rig, the fellow I bought it from demonstrated it using a desk mike (which he wanted to keep). I've not yet had a chance to get in touch with him to find out what he knows about the mic he gave me.

As a side note; the power output needle (on the Drake and the Yaesu) does move to appropriate values when operating 10m CW.

So, anyone know what's happening? I put an Ohm meter across the mic terminals (with the mic disconnected) and saw ~500 ohm impedance.

According to Senator John Lynch's office, S-305 is coming up for a vote shortly in the NJ Senate. This bill repeals Public Law 1977 and makes it a crime to MISUSE information intercepted by radio, while LEGALIZING the installation/use of scanners and wide-band tranceivers in vehicles.

New Jersey residents should call their State Senator TODAY to express support, for this legislation.

If you don't know who your state senator is, call:

NJ State House - 609-292-2121 and ask for the public affairs office.

Call today!

ASA MEMBERSHIP INFORMATION

The Electronic Journal of the Astronomical Society of the Atlantic (EJASA) is published monthly by the Astronomical Society of the Atlantic, Inc. The ASA is a non-profit organization dedicated to the advancement of amateur and professional astronomy and space exploration, and to the social and educational needs of its members.

Membership application is open to all with an interest in astronomy and space exploration. Members receive the ASA Journal (hardcopy sent through U.S. Mail), the Astronomical League's REFLECTOR magazine, and may additionally purchase discount subscriptions to SKY & TELESCOPE, ASTRONOMY, DEEP SKY, and TELESCOPE MAKING magazines.

For information on membership, contact the Society at:

Astronomical Society of the Atlantic (ASA)
c/o Center for High Angular Resolution Astronomy (CHARA)
Georgia State University (GSU)
Atlanta, Georgia 30303
U.S.A.

asa%chara@gatech.edu or asa@chara.uucp

or telephone the Society recording at (404) 264-0451 to leave your address and/or receive the latest Society news.

ASA Officers and Council -

President - Don Barry
Vice President - Bill Bagnuolo
Secretary - Ken Poshedly
Treasurer - Alan Fleming
Board of Advisors - Edward Albin, Jim Bitsko, Bill Hartkopf
Council - Jim Bitsko, Julian Crusselle, Toni Douglas, Eric Greene,
Larry Klaes, Becky Long, Max Mirot, Paul Pirillo,
Patti Provost, Michael Wiggs

ARTICLE SUBMISSIONS -

Article submissions on astronomy and space exploration to the EJASA are most welcome. Please send your on-line articles in ASCII format to Larry Klaes, EJASA Editor, at the following net addresses or the above Society addresses:

klaes@wrksys.enet.dec.com
or - ...!decwrl!wrksys.enet.dec.com!klaes
or - klaes%wrksys.dec@decwrl.enet.dec.com

or - klaes%wrksys.enet.dec.com@uunet.uu.net

You may also use the above net addresses for EJASA backissue requests, letters to the editor, and ASA membership information.

Please be certain to include either a network or regular mail address where you can be reached, a telephone number, and a brief biographical sketch.

DISCLAIMER -

Submissions are welcome for consideration. Articles submitted, unless otherwise stated, become the property of the Astronomical Society of the Atlantic. Though the articles will not be used for profit, they are subject to editing, abridgment, and other changes. Copying or reprinting of the EJASA, in part or in whole, is encouraged, provided clear attribution is made to the Astronomical Society of the Atlantic, the Electronic Journal, and the author(s). This Journal is Copyright (c) 1990 by the Astronomical Society of the Atlantic.

A COMPARISON OF OPTICAL AND RADIO ASTRONOMY

by David J. Babulski

Electromagnetic radiation from space arrives at all wavelengths, from very short wavelength gamma rays to long wavelength radio waves. This wide spectrum of electromagnetic radiation is constantly bombarding the atmosphere of Earth. We humans live on the surface of the planet at the bottom of a giant ocean of atmosphere. This several-hundred-kilometer thick layer of mixed gases filters out most of the impinging electromagnetic radiation, leaving only two substantial "windows" into the Cosmos.

The narrower of these two primary windows is called the Optical Window and includes three portions of the spectrum:

The near-ultraviolet, that is, wavelengths longer than about three thousand Angstroms (an Angstrom is equal to one-hundred-millionth of a centimeter) or 0.3 micrometers (a micrometer is equal to ten to the negative six power or 0.000010 meter).

The "visible" section, which includes the "colors" that we can see: Blue (about five thousand Angstroms or 0.5 micrometers) to red (about seven thousand Angstroms or 0.7 micrometers).

Portions of the infrared (with wavelengths up to forty Angstroms or 0.04 micrometers).

The other, larger portal into the Cosmos is called the Radio Window. It includes wavelengths from about one millimeter to about twenty meters. The long wavelength cutoff depends somewhat on conditions in Earth's ionosphere.

Before we continue with a comparison of optical and radio astronomy, it may be useful to discuss the major component that these two disciplines have in common: Electromagnetic radiation.

Electromagnetic Radiation -

To fully understand electromagnetic radiation, we must first travel back in time. Our first stop is to early Greek history circa 585 B.C. It was around this period that Thales of Miletus (c.624-c.547 B.C.) noted that bits of amber rubbed with fur mysteriously attracted feathers and other lightweight objects. Also during this era, the curious property of the mineral lodestone to attract bits of iron was observed.

These observations were long regarded as curiosities and were generally ignored until the early years of the Nineteenth Century, when such curiosities were described in terms of electricity and magnetism.

In the early 1800s, Charles A. de Coulomb (1736-1806) in France measured the electrostatic force acting against a spring. About the same time, Count Alessandro Volta (1745-1827) in Italy invented a battery which was the first practical source of continuous electrical current.

Stepping ahead twenty years to 1820, Oersted of Denmark demonstrated that a magnetic field existed around a wire which was carrying electrical current. In this same time period, a French physicist named Andre Marie Ampere (1775-1836) described the attraction and repulsion between two wires carrying electrical current in the same or opposite directions.

It was shortly after these discoveries in the early 1820s that Georg S. Ohm (1787-1854) of Germany developed a thermocouple of iron and copper bars. When the junction of these bars was placed in a fire, Ohm noted that electrical current was generated. By using various lengths of copper wire, he formulated the famous laws that bear his name. These laws relate the flow of electric charges (current) in a conductor to the electrical potential (voltage) and the reaction of the circuit (resistance).

By the year 1830, it was fairly well known in scientific circles that when current flowed through a conductor, a magnetic field was formed around the wire. The reverse case was not an easy experiment to verify. Several luckless investigators tried to wrap a wire around a magnet to generate an electrical current in the wire.

In 1831 an English physicist named Michael Faraday (1791-1867) almost accidentally discovered that it was a moving magnet and not a stationary one that produced an electrical current in an adjacent conductor. Faraday proposed the daring concept that all space was filled with various force fields: Magnetic, electric, radiant, thermal, and gravitational. Based on his field theory, Faraday daringly postulated the principles of electromagnetic induction and the field theory, which proved to be the missing links between electricity and magnetism.

In the United States one decade later, a scientist by the name of Joseph Henry (1797-1878) demonstrated the concept that electromagnetic energy could be propagated through space and detected at a distance by noting the inductive action of a spark circuit picked up by a parallel circuit some nine meters (thirty feet) away.

By the 1850s, the various bits and pieces about electricity and magnetism were well known and documented: Coulomb's Law covering the relationship between the electric charge and the mechanical force it produced; Ampere's Law relating electrical current and magnetism; Gauss' Law covering the relationship between electric charge and the electric field; and Faraday's Law, which explained the relationship between the magnetic field and the induced voltage.

It was not until the late 1860s that the brilliant Scottish theoretician James Clerk Maxwell (1831-1879) unified these various laws into a complete electromagnetic theory which is today ranked in importance with Sir Isaac Newton's (1642-1727) concept of gravitation and Albert Einstein's (1879-1955) theory of relativity.

James Clerk Maxwell -

This Scottish physicist and mathematician is generally considered to be the greatest theoretical physicist of the Nineteenth Century. Maxwell became a student of the senior scientist Faraday, studying all of Faraday's work in order to become thoroughly familiar with his concepts and line of reasoning. Maxwell was intrigued by the apparent lack of a unified theory of electric and magnetic behavior.

From Faraday's work and his own experiments, Maxwell derived a breathtaking concept and a set of elegant equations that encompassed the various laws of electricity and magnetism and which form today's basis of electromagnetic theory.

The unique picture presented by Maxwell of the interchange between electric and magnetic fields in free space was supported by a set of equations descriptive of any form of wave motion propagating itself freely from place to place.

Equation 1: $\text{div } E = 0$

Equation 2: $\text{div } H = 0$

Equation 3: $\text{curl } E = -1/c \; dH/dt$

Equation 4: $\text{curl } H = 1/c \; dE/dt$

In these equations, the term "E" represents the electric field, commonly expressed in Volts/meter, and the term "H" represents magnetic induction and is expressed in "Teslas" (1 Tesla = 1 Weber/meter squared).

The term "Div", referring to the mathematical operation "Divergence" is a measure of the total flow of E or H into or out of a point in space. Similarly, the term "Curl" is a mathematical operation measuring "vorticity", the amount of whirlpool-like structure about a point in space. A detailed analysis of Maxwell's Equations is beyond the scope of this article. However, a brief discussion of what each of the four equations describes follows:

Equation 1 states that in the absence of electric charges, electric lines of force can neither be created nor destroyed.

Equation 2 states that in the absence of electric charges, magnetic lines of force can neither be created nor destroyed. In addition, Equation 2 states that magnetic charges do not exist.

Equation 3 is a generalized statement of Faraday's Law that a changing magnetic field produces an electric field and that the ratio of the electrostatic units to the electromagnetic units is a constant related to the speed of light (300,000 kilometers per second/186,000 miles per second).

Equation 4 states that a changing electric field produces a magnetic field.

These four equations also showed that a "disturbance" in the electromagnetic field did not die out, but rather could propagate outwards from its origin in the form of waves traveling at the speed of light.

Maxwell termed such a disturbance in the electric and magnetic fields an "electromagnetic wave" and pictured it as an electric wave at right angles to a magnetic field with both waves propagating in phase. Maxwell was able to show that these waves have all the known properties of light. Light was therefore discovered to be an electromagnetic phenomenon.

As the 1800s neared an end, Heinrich Hertz (1857-1894) of Germany succeeded in generating electromagnetic waves of long wavelength, which we now call radio waves. Further, Hertz found that the velocity of these long waves was exactly equal to the velocity of light. Thanks to Maxwell and Hertz, we now know that light and radio waves are both forms of electromagnetic radiation, with light being composed of very short wavelength and radio waves composed of very long wavelength. Equation 5 shows the mathematical relationship between wavelength and frequency:

v = c/lambda

In Equation 5, the symbol "c" equals the speed of light in meters per second; the Greek letter lambda is the wavelength in meters; and the symbol "v" equals the frequency in Hertz (or cycles per second). A more convenient arrangement is to convert Hertz to megahertz (abbreviated "MHz"). The revised mathematical expression is shown in Equation 6:

v (in MHz) = 300/lambda (in meters)

To see how this relationship works, let us convert the mid-point wavelength of the Optical and Radio windows to their corresponding frequencies.

The mid-point wavelength of the Optical window is about two micrometers (or 0.000002 meter). Using the relationship in Equation 6, the corresponding frequency is 150 million MHz - a very high frequency indeed!

At the other extreme, the mid-point wavelength of the Radio window is about 0.5 meters. Again, using the relationship in Equation 6, the corresponding frequency is about six thousand MHz, or six gigahertz (GHz).

Most amateur radio telescopes operate in the meter wavelength range. For example, the radio telescopes described later in this series of articles will operate at a wavelength of about 2.9 meters. Using the relationship in Equation 6, the corresponding frequency is about 103 MHz.

With this perspective in mind, we will now look at the instruments used to investigate these two regions of the electromagnetic spectrum.

Short Wavelength Astronomy -

For millennia, humans were able to observe the Cosmos with only their unaided eyes. History has shown that the construction of major observatories has been a continuous practice for a wide variety of cultures of varying levels of sophistication.

However, for most of recorded time, these ancient observatories were concerned almost exclusively with astrology and not astronomy. Telescopes, as we know them today, were a relatively late addition to the complement of instruments in observatories. This is somewhat surprising, as the technology for making glass is ancient. The Mesopotamians were the first to fuse sand and ash together to form glass. By the year 1200 B.C., the Babylonians knew how to make objects of blown glass and the Chinese were manufacturing mirrors long before the birth of Jesus Christ.

However, no one put this technology together to make a telescope until sometime in the early 1600s. Spectacles were in use in Europe by the late 1300s, and it was probably a happy accident by an obscure spectacle-maker that resulted in the first telescope.

By chance, if one aligned two lenses, one concave and the other convex, objects far away appeared to be closer. Once the first telescope was made, word traveled quickly throughout Europe - so quickly, in fact, that it was impossible to ascertain the original inventor. Most scholars now believe that the actual inventor of the telescope was Dutch spectacle maker Jan Lippershey.

On August 25, 1609, the Italian astronomer Galileo Galilei (1564-1642) demonstrated one of his first telescopes, which had a magnification factor of nine, to officials of the Venetian government. A magnification factor of nine, or 9x, means that the object being viewed appears nine times closer than it actually is.

Although he had won over the Venetian officials, Galileo did not use this new instrument to observe the heavens right away. First he designed a more stable mount, then improved the optics to raise the magnification factor to thirty.

Perhaps more importantly, Galileo had to gain confidence in this new instrument, the "telescope". In the early 1600s, the eyes were believed to be the final authority about the truth of sizes, shapes, and colors. Lenses and mirrors were known to distort images by enlarging them, reducing them, or even inverting them. Galileo spent several months and countless experiments to convince himself that what he observed through the telescope was indeed real.

Once Galileo did turn the telescope toward the night sky, humanity's view of the Universe was changed forever. His observations of the four largest moons of the planet Jupiter and their motions demonstrated without doubt that Earth was not the center of orbital motion. This observation established empirically that one body (a moon in this case) could orbit a second (Jupiter) while the second body, in turn, orbited a third body (Earth's star, the Sun). The realization that the Milky Way Galaxy was composed of countless individual stars brought forth the idea that the Universe could be infinite in extent.

The Refracting Telescope -

The telescope that Galileo used to make these startling observations was a refractor telescope. A refractor consists of an objective lens at one end of a long tube and one or more lenses (which form the eyepiece) at the other end. Contrary to popular belief, it is the diameter of the objective and not the magnification of the eyepiece that is important in any telescope.

The primary job of any telescope is to gather as much electromagnetic energy (in this case, visible light) as possible. An image of a far away object, say a star, is a point of light surrounded by a diffraction disk.

The resolving power of a telescope (or how much "detail" can be revealed) is dependent on the size of the diffraction disk. The smaller the diffraction disk, the more detail can be resolved. The size of the diffraction disk is, in turn, directly related to the wavelength of the electromagnetic energy (light in this case) and the diameter of the telescope objective.

In general terms, the larger the objective the smaller the diffraction disk. If the wavelength and objective diameter are measured in the same units (for example, both measured in centimeters), then the smallest angle alpha (Greek letter) in seconds of arc that can be resolved by a lens (or mirror) of diameter "d" is given by the relationship shown in Equation 7:

alpha = 2.1 x 10 (to the fifth power) x lambda/d (arcseconds)

The formula shown in Equation 7 is called the Dawes' Criterion. It represents the theoretical resolution for a telescope. An example for telescopes of ten-centimeter (four-inch) and twenty-centimeter (eight-inch) diameter objectives may be instructive: In the examples shown in Table 1, wavelength (lambda) will be ten to the negative five centimeters (or 5,500 Angstroms - visible light in the yellow-green portion of the spectrum).

Table 1: Maximum Resolution of Optics (Dawes' Limit)

Aperture	Resolution
60 mm	1.93"
3"	1.52"
4.5"	1.02"
6"	0.75"
8"	0.58"
10"	0.46"
12.5"	0.37"
16"	0.29"

From the table, a ten-centimeter (four-inch) diameter telescope has a Dawes' Limit of 1.16 seconds of arc. This means that two celestial objects separated by 1.16 seconds of arc or greater will be resolved as two separate objects. Celestial objects separated by less than 1.16 seconds of arc will not be resolved and will appear as one object.

To give you some sense of scale, the diameter of a period appearing on this screen/page is about 180 seconds of arc when viewed from a distance of nine meters (three feet). That same period would subtend a distance of 0.023 seconds of arc when viewed from a distance of 0.8 kilometers (0.5 miles). By increasing the diameter of the telescope objective, the Dawes' Limit is correspondingly decreased. This same mathematical relationship also holds for radio telescopes, as we shall see.

Telescopes larger than twenty-five centimeters (ten inches) cannot reach the Dawes limit except under exceptional seeing conditions because of turbulence in Earth's atmosphere. To achieve their true potential, methods must be employed such as speckle interferometry, which removes atmospheric blurring by analysis of many freeze-frame snapshots of an object. At the present time, the largest refracting telescope on Earth has an objective lens of one meter (forty inches) in diameter. This refractor is at the Yerkes Observatory in Williams Bay, Wisconsin. The instrument went into operation during the 1890s.

Refractor telescopes tend to be somewhat expensive due to the high cost of the objective lens. Typically, modern refractor telescopes designed for the amateur astronomer tend to have objective diameters of ten centimeters (four inches) or less.

The Reflecting Telescope -

Most modern telescopes for short wavelength (optical) astronomy are of the reflector type. Unlike the refractor, the reflector telescope uses a parabolic mirror at the bottom of a long tube rather than a lens at the front of the tube. All of the large research telescopes are reflecting telescopes, with this type also being the most popular among amateur astronomers.

The reflecting telescope was first conceived by James Gregory, a Scottish scientist, in 1663. Sir Isaac Newton, a British physicist, is generally credited with the first practical reflector telescope, which he built in 1668.

There is a fundamental problem with using a mirror to collect and focus an image. To see the image you must place your eye at the point where the electromagnetic energy is focused (called the "prime focus"). Unfortunately, your head will get in the way and you will not see anything!

Newton got around this problem by placing a small mirror at an angle in the middle of the telescope tube. This mirror deflects focused energy from the mirror to a point outside the tube. This type of reflector is called a Newtonian, in honor of its inventor.

Another type of reflecting telescope was invented by the French mathematician Guillaume Cassegrain (c.1650-1700) in 1672. Cassegrain reflectors use a small convex mirror to intercept the energy from the primary mirror and reflect it back through a hole in the primary mirror. This type of telescope has the advantage of small physical size, as the energy path is folded inside the tube and is sometimes called a Catadioptric (meaning literally "many optical surfaces") telescope.

A more recent reflecting telescope design which is very popular with amateur astronomers is the Schmidt-Cassegrain reflector. This is a catadioptric-type reflecting telescope using a spherical primary mirror at the bottom of the telescope tube and a lens-like corrector plate at the front of the tube. The corrector plate compensates for astigmatism from the spherical reflecting surface. The Cassegrain secondary mirror is mounted to the inside surface of the Schmidt corrector plate. This telescope type has the advantage of lower cost (It is cheaper to make a spherical mirror than a parabolic mirror) and small size with excellent field of view.

The energy gathered by the telescopes described so far can be processed by our eyes. Because we can "see" the images produced by the telescope, astronomers use the term "magnitude" to describe the "brightness" (the amount of short wavelength energy flux, or light energy) received from a star or other luminous body.

The system of magnitudes currently used by astronomers to denote the brightness of stars was invented by the ancient Greek astronomer Hipparchus (c.180-c.125 B.C.). The brightest stars Hipparchus saw in the sky he called first magnitude stars. Those about half as bright he called second magnitude and so on to the sixth magnitude, which were the dimmest stars he could see. Later, when telescopes came into use, astronomers extended the Hipparchus magnitude scale to describe the dimmer stars that they could see in their instruments. Over time astronomers have refined the magnitude scale so that each magnitude difference of one corresponds to a factor of 2.512 in light energy flux. The apparent magnitude scale is shown below:

Sun (Sol)	-27
Full Moon	-12
Venus	-4
Sirius	-2
Unaided eye limit	+5 to +6
Binocular limit	+10
Pluto	+14
Visual limit for large telescopes	+20
Photographic limit for large telescopes	+25

One should be careful not to confuse "apparent magnitude", which is how bright the star looks to us from Earth, with "absolute magnitude", which is how much light energy the star is actually producing.

The absolute magnitude of a star is the apparent magnitude it would have if it were moved to a distance of exactly ten parsecs from Earth. Note: One parsec is a unit of astronomical distance equal to 3.26 light years. Therefore, ten parsecs is equal to a distance of 32.6 light years. For example: If the Sun was at a distance of ten parsecs from Earth, it would have an apparent magnitude of +4.8. The absolute magnitude range of other stars varies from -10 for the brightest to +15 for the dimmest.

Now that you know about the most common instruments for short wavelength (optical) astronomy, let us next look at instruments for long wavelength (radio) astronomy.

Long Wavelength Astronomy -

Unlike optical astronomy, we humans cannot "see" energy flux at radio wavelengths. In order to process energy flux at radio wavelengths, we must use a collection device to capture the energy flux and a conversion device to convert the received energy to a form that we can readily process. Astronomers call the radio energy flux collection device an "antenna". Conversion of the received radio energy into a form that we can process is handled by a "receiver".

In most cases, radio telescopes are categorized by the type and size of the antenna used. Most of the professional radio telescopes are categorized as Large Dish Antenna ("LDA") types.

Because we can not "see" electromagnetic energy at radio wavelengths, we must devise another way to describe the "brightness" of a radio source. Instead of the term "magnitude" to denote the brightness of an energy source, radio astronomers use the term "flux density".

The basic unit of flux density is "Watts per Square meter per Hertz". However, as most radio sources are extremely small fractions of that value, the basic unit of flux density is defined as a flux unit. One flux unit is ten to the negative twenty-sixth power watt per square meter per hertz.

To give you a sense of scale, the Sun has an average flux density of ten to the fourth power or ten thousand flux units at a frequency of about 150 MHz. Earth's Moon, in contrast, has a 150-MHz flux density of only 85 flux units.

Unlike optical astronomy, the most powerful radio source in the sky is not the Sun, but an extragalactic radio source named Cassiopeia A at a 150-MHz flux density of seventeen thousand flux units!

We can think of a radio telescope as analogous to an optical telescope in the following ways: The antenna in a radio telescope is analogous to the objective lens in an optical instrument. The Receiver is analogous to the eyepiece. Keep in mind that one does not "listen" to the output from a radio telescope in the same way that you listen to a conventional radio tuned to a typical radio station. The electromagnetic energy flux detected by the radio telescope covers a very wide band of frequencies and sounds very much like static.

A conventional radio uses a radio frequency filtering system to select a very narrow range of frequencies and reject all others (as when you "tune in" a radio station).

A radio telescope receiver, on the other hand, uses a similar radio frequency filtering system, not to select a very narrow frequency band, but rather to reject narrow band frequency interference from adjacent radio services. We want the radio telescope receiver to be as wide band as possible, in order to capture as much radio energy flux as we can.

In most cases, the output from a radio telescope is converted to digital code for computer processing or, as is the case with most amateur instruments, is converted to strip chart recorder output. In this later case, the position of a line on a sheet of graph paper represents the level of radio energy flux received by the radio telescope.

We can take our optical telescope analogy one step further in describing the types of radio telescopes. Remember, there are two fundamental types of optical telescopes, the refractor and the reflector. In like fashion, there are two basic types of radio telescopes: The Multi-Element Array (MEA)-type antenna, which is roughly analogous to the optical refractor, and the Large Dish Antenna (LDA), which is roughly analogous to the optical reflector.

Radio Telescope Refractors -

The typical MEA-type antenna is based on the Yagi-Uda multi-element antenna, usually called a "Yagi", in honor of its primary inventor. A conventional television antenna is an example of a Yagi antenna. This type of energy collector concentrates incoming radio energy flux toward a collecting element (usually called a "driven element") by using electrically isolated parasitic elements in front of and behind the collecting element.

An electrically conductive feedline (usually coaxial cable) is connected to the collecting element to convey the received radio frequency energy to the receiver. Electric currents are induced in the parasitic elements by the passing electromagnetic wave.

These induced currents in turn generate wave fronts of radio frequency energy that constructively or destructively interfere with the incoming radio energy. By adjusting the spacing between the parasitic elements and the collecting element and the length of the parasitic elements, the induced wavefronts can cause incoming radio energy flux to be concentrated at the collecting element. The parasitic elements in front of the collecting element are called "directors" and the parasitic element behind the collecting element is called a "reflector".

A multi-element antenna, such as the Yagi type just described, is said to be "directive" and has "gain". That is, the antenna is most sensitive or responds most readily to incoming radio energy flux in the direction that the directors are pointing. The term "gain" refers to the power gain of the antenna, or put another way, how much of the radio energy is concentrated toward the collecting element and is usually expressed in decibels (dB).

Another interesting antenna used in arrays is the Helical antenna invented by Dr. John Kraus of the United States in the early 1940s. This type of antenna uses a continuous antenna element in the shape of a coil or helix working against a ground plane.

A helical antenna has two characteristics that make it especially interesting for radio astronomy applications: The helix is circularly polarized (Contrast this with the Yagi antenna, which is linearly polarized), and its combination of broad bandwidth and high gain.

Unfortunately, the cross-sectional area, or aperture, of a single, multi-element antenna is rather small. The cross-sectional area, or the "effective aperture", of an antenna is not as straightforward as it might seem, but is a function of both antenna directivity and the antenna design center wavelength.

The mathematical relationship called Dawes' Criterion also applies to radio astronomy as well as the optical branch. As we have learned earlier, an optical telescope with an aperture (objective lens diameter) of ten centimeters (four inches) can resolve an astronomical object to within about one arcsecond.

The primary difficulty with radio telescopes is that the wavelength of radio energy is much greater than that for visible light energy. For example: Radio energy at a wavelength of twenty centimeters is roughly 400,000 times longer than the wavelength of visible light. As a result, to resolve the same angle of one arcsecond at a wavelength of twenty centimeters, a radio telescope would have to be nearly forty kilometers (24.8 miles) in diameter.

Fortunately, there are ways around this problem which will be discussed later. How much detail a radio telescope can resolve is a function of its "beamwidth". The "beam" is a cone-shaped bundle of radio energy of such an angular size that within it details cannot be resolved. The beam width would correspond in optical astronomy to the angular size of the central diffraction disk of a stellar image.

For a large optical telescope, that size would be roughly a few hundredths of a second of arc, but for a typical large radio telescope, the beam width is on the order of several minutes of arc. The beam width of a typical single multi-element Yagi antenna (similar to what may be used in a small amateur radio telescope), for example, is on the order of fifteen degrees! However, by connecting a large number of multi-element antennas together electrically in phase, the beam width can be reduced to about one to two degrees - still a far cry from one to two arc seconds!

The size of the antenna beam depends to a large degree on the wavelength. In general, the shorter the wavelength (the higher the frequency) the smaller the antenna beam. One way around the problem of large beamwidth is to use a techniques called "interferometry". In this technique, two identical radio telescope antennas are placed some distance apart. Incoming radio energy flux will strike one antenna a brief instant before the other one so that the two antennas will receive the same energy at slightly different times and thus will be "out of phase" with each other. The difference in phase between the two antennas can be measured electronically.

Because this phase difference depends on the angle of the radio source relative to the antennas, positional information on the radio source can be readily obtained with this technique. One of the projects to be discussed in this series is a two-station radio interferometer.

Radio Telescope Reflectors -

In an effort to reduce antenna beamwidth and improve the sensitivity of a radio telescope to weak sources of radio energy flux, radio astronomers shorten the radio wavelength at which they will observe and employ large reflecting "dish" antennas to collect and concentrate the radio energy. The form of these reflecting radio telescopes closely follows the form of their optical counterparts. It is interesting to note that the highest gain antenna on Earth (148 dB) is the five-meter (two hundred-inch) telescope on Mount Palomar in California. The very short wavelength of light energy causes such a high gain to be realized.

One of the most common radio telescope reflectors is the "Prime Focus" arrangement In this radio telescope configuration, the receiver is located at the prime focus. Another common radio telescope reflector arrangement is the Cassegrain system. This arrangement is similar to its optical counterpart in that a primary parabolic reflector and a convex secondary reflector are used to "fold" the radio energy path. This arrangement has the advantage of slightly smaller size and placement of the receiver where it is easier to adjust and service. The Cassegrain system (and its cousin, the Gregorian system, which uses a concave rather than a convex subreflector) is usually only used in very short wavelength radio astronomy (centimeter wavelengths and shorter). As the radio wavelength gets larger, the size of the sub-reflector must also get larger. A point is soon reached where the amount of energy blockage caused by the sub-reflector negates any advantage of the system.

Summary -

Speaking in general terms, both optical and radio astronomy are observing the same thing: Electromagnetic energy. The primary difference is the wavelength of the electromagnetic energy: Optical wavelengths being very short and radio wavelengths being very long. Since we can "see" optical wavelengths as visible light, our brain can be used in conjunction with our eyes to process information gathered by the telescope. Because we can not see in radio wavelengths, we typically use electronic devices to process the received energy collected by a radio telescope and convert it to a form that we can then "see". Astronomically speaking, the primary advantage of radio astronomy is its ability to detect energy sources hidden behind dark obscuring matter. This dark matter blocks the shorter wavelengths of visible light, but the longer wavelengths of radio energy are able to pass through the dark matter.

Another application of this characteristic of radio energy is Radar Astronomy. In this application, a high energy pulse of electromagnetic energy, at radio wavelengths, is directed toward an astronomical object. The reflected energy is then used to deduce details about that object. For example, the surface of the planet Venus is hidden from view at optical wavelengths by the planet's thick obscuring clouds. By using radar astronomy, we have been able to create computer-generated images of what the surface of cloud-covered Venus looks like. Radar astronomy has also recently been used to study the surface of the planet Saturn's largest moon, Titan, which is shrouded in thick orange clouds of nitrogen and methane.

Although radio astronomy has been a relatively late addition to the discipline of astronomy, it serves as a valuable "second eye" into the Cosmos. Because radio astronomy is a relatively young discipline, it offers the amateur radio astronomer a unique opportunity to work alongside the professional astronomical community to make valuable contributions to science. Future articles in EJASA will describe how to construct small, relatively inexpensive radio telescopes for use by amateur radio astronomers.

Editor's Note -

ASA members Bill Black and Jeff Lichtman coordinate a Radio Astronomy Interest Group for those who wish to pursue this important branch of observational astronomy. Both men operate their own radio telescopes: Bill's instrument detects meteors by reflection of distant television stations from ionized trails in the upper atmosphere. Jeff's dish measures intensities of variable sources. Low-cost availability of computers and radio components has opened the doors for amateur participation in this field. If you wish to learn more about the RAIG, please contact the ASA at one of the addresses listed in this EJASA.

Jeff is also President of the national Society of Amateur Radio Astronomers (SARA), an organization of nearly 250 radio hobbyists. For more information on SARA, please contact Jeff at the following address:

W2SZ/1 will operate a multi-op station high atop Mt. Greylock in Adams, Massachusetts. Our location is:

Grid: FN32
Elevation: 3491 ft.
Latitude: 42.6364 degrees
Longitude: 73.1667 degrees

We will have active stations on *all* bands up to 24 GHz. If you would like to sked a contact, please E-mail me by 4:00pm Thursday afternoon.

We shall be on the calling frequencies of 903.100 Mhz and 1296.100 Mhz for the most part,

and you can establish contact to make a sked
for microwave contacts there if needed. We can
also be reached at * 518-864-5472 * during the
contest.

On the higher bands, we can be worked at:
2304.020 Mhz
3456.020 Mhz
5760.020 Mhz
10368.020 Mhz

We will of course be operating 6 meters, 2m,
220, and 432 stations. If you hear us on any
of these bands, give us a call and make a
sked for a higher band if you can.

Everyone can join in on the fun. It is,
after all, a QSO *Party*! If you have an FM
rig with 2 meters, 220, or 440 capabilities,
look for us on the following FM simplex freqs.
146.550 Mhz
223.500 Mhz
446.000 Mhz

****
See you on the air guys.......

Last night I worked an OMxxx who said to "qsl via the buro". There
has been enough here about how managers work, but how about bureaus?

Do I mail my card to his bureau with IRC, or does he reply to the US bureau?

My callbook lists OL and ON as Czechoslovakia and Belgium with OM
allocated to the Czechs but none issued yet, so unless I hear
different, I will assume it is Czech.

The Kenwood 731 has two antenna ports. I highly recommend
this radio. It is the best dual-bander I've ever used.

It has 14 memories per band, plus a seperate VFO per band,
plus a call channel. I've got more memories than I know
what to do with. And it is easily modified to receive
out of band (so it can be used as a scanner to listen
to the fire dept, etc).

It is also easily modified (just clip a diode) to operate
as a "cross-band repeater", which allows you to use the
radio as a "mobile extender" from your low-powered HT.

Yes and no. You don't need the IRC; just mail the card. However, that's still
a 45c stamp. If you're a big gun and work 1000+ DX stations a month, then you
*may* want to speed up your replies by bundling all your Russian QSL's, etc.
and sending them to the buros yourself.

The other method, for everyone else (like you & me) is to use the ARRL's
Outgoing Buro. If you're a League member, the details are in QST every few
months or so. Basically you sort your cards by prefix, mail 'em to Newington
with $2 per pound, and *they* send the mail sacks overseas. You gotta be a
member to use it. If that doesn't seem fair, remember that most DX stations
have to be a member of their League to even get *incoming* cards.

You assume correctly. I've been hearing OM calls for a few weeks now.

I have seen several postings concerning the ICOM IC-24AT. This is the latest/hotest hand held tranceiver from ICOM, the local radio shops (there are three of them in the area) can't keep these things in stock, one store sold 10 of them in less than a week! Most postings were concerning how to "modify" the radio to expand its receive range, and how to get it to do 'cross-band-SIMPLEX-repeat' functions.....

Well, I purchased one of these neat little 'babies' for my wife!!! She recently passed her Extra exams (she is now WG1G), and held me to my promise of buying her any radio that she wanted if she passed the Extra. (Boy, am I glad she doen't *like* CW and has not YET found out how much fun the HF bands are... I might have had to buy her an IC-781..... about $6,000.00!!!).

So I thought that I would let the net know what I have found out about this radio first hand.... (instead of a 'I heard that it can do this' message).

The radio is very well designed (in my opinion). No, there is not just one Integrated Circuit inside the thing!!! It appears to be very ruggedly constructed. Out of the BOX it does everything that ICOM says.

One thing that is confusing in the advertisements.... they state that each memory channel (there are 40 of them) is 'double spaced' and can hold a separate frequency for each band. This implies to me that I should be able to use about 80 channels (since the radio has two bands, 2 meters, and 70 cm). What this really means is that each memory 'channel' can hold all information concerning offset, split, etc... and including, FOR CHANNELS PROGRAMMED AS FULL DUPLEX or 'split' mode, both frequencies used for the 'split' operation (this 'split' is for full duplex-cross-band, not a transmitter offset for repeater use). Although you can (with some button pushing) use each frequency stored as 'split' in a simplex mode, you have to not mind pushing a few buttons.

By the way, only one 'band' can be active at a time... you can't listen to both bands at the same time. My wife thinks that this is a blessing... If you were able to listen to both bands at the same time, there could be confusion on which band someone called you from.

Here is some of the "interesting" information. The so-called "modification" to enable the wide range RECEIVE ONLY frequency converage did NOT require any hardware changes to the unit.... (a FEW early units did require a diode to be removed)... simply hold down a few buttons when turning on the unit and keep them held until the unit is done with it's self test (Light-B-#).

If you also do one of the following (each one override the other) you can 'modify' the method used to enter the frequency: (Hold down the indicated keys WHILE turning on the power switch)

Light-1	must enter the 1 MHz through 5 KHz (4 digit entry)
Light-2	must enter the 10 MHz throuth 5 KHz (5 digit entry (default))
Light-3	must enter the 100 MHz throuth 5 KHz (6 digit entry)

When the Light-3 mode is set, I can get the radio's display to go from 0.000 to 1.3GHz (or so, enter 999.995 MHz and then use the 'vfo' knob to 'scroll' up into the 1 GHz 'display' range).... sorry to report that the dislpay shows that the PLL is 'unlocked' over *most* of this range.

The radio will RECEIVE (only) on many interesting frequencies... alas, some have lower sensitivity (this is acutally a plus, the radio's front end is not as wide open as a 'barn door').

I have heard significant signals on the aircraft band (Yes it does demodulate the AM signals here), the Marine, and VHF commercial range (including NOAA weather), and a lot of interesting signals around the 800+ frequency range. Sorry to say that the sensitivity is a bit lacking around the 220MHz range. I live less than 1/2 mile from a 220MHz repeater and I couldn't hear the repeater on the IC24AT with it's flexible antenna... yet I could hear a 1 watt handheld when used on my property (line of sight??).

The radio offers a significant number of scanning modes, searching, etc, that can be programmed as each user desired... see the manual, there are too many 'programmable' modes to mention here.

The ONE hardware mod that I performed on my radio (oops, her radio) was the removal of a diode from the CPU board... the diode is VERY easy to locate (D14), it is NOT a 'surface mount' device, and it's very obvious, it can be 'clipped' out if the user is not handy with a soldering iron (if you are not handy with tools, DON'T dive into your radio... get someone to help you who is technically able).

After D14 is removed, the radio can be placed into 'cross-band-simlex-repeat' mode by pressing a few buttons (Function-5D). This works ONLY when the radio is set to 'split' mode (Function-C). The way it works is as follows:

Program two SIMPLEX frequencies into the VHF and UHF vfo's and set the radio for cross-band-full-duplex (press Function-C until the 'split' indicator is displayed) (or use a memory channel programmed for 'split' operation), then put the radio into 'reapeat' mode (press Function-5D). The radio will start to quickly 'scan' back and forth between the two frequencies. When a signal opens the squelch on one band, the transmitter turns ON on the other band, viola! instant SIMPLEX repeater! When the first signal drops its carrier, the radio continues to scan the two frequencies. To turn off the 'repeater' function, press Function-D.

This works great, and will allow a 146MHz to 440MHz 2 way link. But you must remember that it is a SIMPLEX link. As long as there is a carrier present, the transmitter is ON for the other band. DON'T TRY TO LINK TO A 'STANDARD' REPEATER in this mode. One drawback (or blessing) is that the transmit offset is cancelled when in split mode. This forces a simplex circuit on each band.

We have used these types of things to allow hams without 146MHz hand held radios to work with a public service event that is using a 146MHz simplex frequency as the operating frequency. One of these babies set to 'link' in a 440MHz to the operating 146MHz frequency allows hams with 440 hand helds to operate. We just have to be careful about several things....,
there is no (auto) IDer... so we need to remember to ID the link in voice.
Also, don't remote mount one of these babies... if something goes wrong, the only control is to walk up to the unit and turn it off, or press some buttons.... BE CAREFULL out there, and refer to part 97 of the FCC rules governing links, remote bases, repeaters, and other such things!!!

I hope *someone* finds this information useful.   I am sorry that I don't have the radio in front of me so that I can describe a lot of other things that it does... But my wife will not let me near the thing!!! She says that everytime I pick it up, I reprogram it, and don't return it to her 'favorite' settings.... Gee, maybe there is a way to program its mode for a particular operator, with password security, and such!!!! I'll just have to sell my IC-u2AT, IC-3AT so that I can afford one of these IC-24ATs for myself!!!

Rich (NM1D)

Your modem requires telephone line levels of +30 to +36 dBm??!!?!? I don't
think so. You must be thinking of the ON HOOK DC from the PBX or Central
Office....not the AC signal levels on the line.

-> Could earning money in excess of the cost of QSL cards, postage, etc
-> be considered doing buisness on the air? Just like VE's aren't allowed
-> to charge more than the cost of materials for exams, couldn't the same
-
-With few exceptions...the manager does not
-request more than the cost of returning the card. In fact, consider
-that, if one sends a manager a SASE with his/her card, then the
-manager AUTOMATICALLY is out some money due to QSL card printing.
-Admittedly that isn't much, but when you get something in excess of
-500 cards per month (as I do), it adds up. Add to that the cost of
-replying to bureau replies (the envelopes at the bureau, postage and
-cost to send back thru the buro, etc...) NOT TO MENTION THE TIME!,
-QSL managing isn't a profitable situation.   (Note...some managers
-DO NOT reply to bureau cards, but there is increased pressure from
-various ham organizations to do so).
-
-The folks that send a greenstamp for return postage without being
-required to do so are essentially 'donating' to the QSL manager's
-war chest. I think your point is interesting, but unless required,
-the money sent above and beyond the cost of returning a QSL is
-usually an attempt on that ham's part to keep the Manager from
-LOSING any more money, rather than 'padding his/her wallet'. As
-mentioned earlier, of all the DX stations I QSL for, the balance
-runs positive for only one, that because he is extremely rare, and
-does some 1000+ contacts a month, often on rare modes (VHF,
-Satellite, RTTY, etc). The balance is kept near '0' by sending
-equipment to further these operations. I am more comfortable doing
-this than 'pocketing' the change, but this decision is my own. I
-suspect, having been in this arena for some time, that managers are
-not a profitable function. If you doubt it, try being one sometime!
-
-73, steve ku9c

In my original article I didn't intend to imply that all or even most
QSL managers are trying to line their pockets!! I understand that the
vast majority are volunteering their time and efforts (and sometimes money)
to the cause, and I appreciate that. The problem I have is with folks who
say, "You want my QSL? Send SASE and $1." If they expect me to pay return
postage that's OK, but I fear too many people are using QSL cards to finance
trips and the purchase of new equipment. This income is earned over the air,
and IMHO, could be construed as business/using Amateur radio for profit.
QSL'ing is for the joy of collecting cards from exotic places, not for trying
to finance your next DXpedition or your next rig out of it. If money is
earned(?) above and beyond the cost of QSL'ing, I think that (ideally) it
should go back to the Amateur community at large, either donated to RACES
or other worthwhile public service, Amateur related groups. Another place
that needs money is for educating the young about AR. What about setting
up a program (like uniden) to donate radios/time for schools out of this
money? Just a thought. I'm sorry if I offended any QSL managers - you don't
set your Dx station's policy for QSLing, they do. I know you put in long
hours and lots of labor, and I certainly do appreciate it!

In lrj@helios.tn.cornell.edu Lewis R. Jansen writes

>I put an Ohm meter across the mic terminals (with the mic disconnected
>and saw ~500 ohm impedance.

Impedance is a term that is associated with AC circuits. An ohm-meter is a DC circuit instrument. Although the term "ohms" is used as the unit of measurement of resistance and impedance, the two are not synonymous. An ohm=meter cannot measure impedance *UNLESS* you are positive that what you are calling impedance is a pure resistance.

If there is a capacitance or inductance anywhere in the circuit path you were measuring, the impedance could be far different from the resistance you saw on the meter. Note that the formula for impedance (Z) includes resistance, capacitance and inductance:

```
                 /---------------
       Z = sqrt (R-square + (XL - XC))
```

If by keying the transmitter you get a different-from-normal reading with NO modulation, I would doubt that the input and mike impedances would be a consideration. It would be better to know what the pin-outs of the mike are compared to what the rig's mike connector wants to see. Sounds more like a keying-line problem to me. I'd double check the connector wiring for the mike against the FT-101 schematic.

Errata the formula above should have read:

```
       Z = sqrt (R squared + (XL - XC) squared )
```

With a California trip fast approaching, and plans to be in
Sacramento, San Francisco and Los Angeles over a 3 and 1/2
week period, I hope to do some operating on 2 meters. Does
anyone have a listing of OPEN repeaters for these areas? I'm
told by some people who've been to these areas that there are
a lot of closed repeaters and that it's very difficult to find
many that are open to all users.
Also as most of my time will be spent in the Sacramento and
San Francisco areas, I plan on doing a little shopping as well.
I hope to trade in my ICOM micro 2AT on a 2SAT, and possibly
pick up a couple of other goodies (good second hand if I can
find it).
So would anyone have any recommendations on Ham Stores in
Sacramento particularly??
Please E-Mail
Thanks in advance.

The latest (June '90) issue of CQ has a letter in the letters-to-the-editor column from a QSL manager about some of the problems and expenses he has, and he suggests they run an article explaining *all* the details and proper procedures for QSLs via bureaus and managers. There was no editorial response indicating that the magazine would do this, but, since there's been so much discussion here on the net about this topic, I think one of you out there could make a little money on the side by writing such an article and submitting it to CQ. I know that I didn't really understand what the problems he was complaining about really were, and I'm sure others could use clear and detailed explanations, aimed at a level starting with the very basics, and written with practical considerations in mind -- exactly what actions should the ham take, and what should the manager/bureau do, to handle all this stuff with the maximum efficiency, speediest turnaround, and minimum cost (to *all* concerned).

(If anyone out there does this, do it on-line, and send the list an electronic copy of the article so we can compare it with the edited version that eventually gets published. So many people claim magazine editors mangle their submissions that it would be informative to have a chance to see the "before and after" of such an exercise.)

Regards, Will

If they would use them, it might be nice to let them be chosen only by extras who had had amateur (extra class) licenses for some long continuous period, like 25 years or more.

There is a great difficulty in choosing a method which is somewhat fair, and I think this method is fair, and it would also be possible to make sure that the demand didn't exceed the supply by making the long continuous period long enough.

Also, I think you might have overlooked, K0-K9, N0-N9, W0-W9, and AA0-AL9.

Reguarding the burger place....

While I'm in the mobile, I'm usally yacking at my pal who lives about 2 blocks from me, and when I get to the window, the girl usally has a goofy look on her face. I have an AS 927 antenna, which is pretty fine, and un-noticible, esp from the angle of her position at the driveup window.

I ask her, "What's wrong?" not realizing I'm bleeding over again, to which she replied "Something strange is happening..."

Then I realize what happened, and pick up the mike, turn it up all the way, and
said to look for Rod Sterling, she turned around as I was still keyed up...

"THAT'S SOOooo WIERD!!"

I now play little mind games with them, mumble something like Cancel the order,
and I'd like a orange drink instead, when there's no one at the intercom...

I think special call signs such as these should be reserved for those
hams who have in some technical way advanced the state of the art.
There'd be damned few qualified applicants.

Let's start rewarding quality instead of quantity, eh?

Just a little while ago I had the pleasure of working Stan, N1HAM. Now
THERE'S a call you could be happy with!

73,
Dube   N5PDK

P.S. Stan's in Bangor, Maine, in case you want to point your beams his way.

> If they would use them, it might be nice to let them be chosen only by extras who had had amateur (extra class) licenses for some long continuous period, like 25 years or more.

Seems reasonable, although I'd think I'd rather hold them for things like special events and such.

We could also have a super class requiring an EE dissertion and 40 WPM and them have them.

> There is a great difficulty in choosing a method which is somewhat fair, and I think this method is fair, and it would also be possible to make sure that the demand didn't exceed the supply by making the long continuous period long enough.

No matter what system might be considered, it would be very important for the FCC to recycle the calls.

> Also, I think you might have overlooked, K0-K9, N0-N9, W0-W9, and AA0-AL9.

I believe these were aallocated to something else. They definitely were not allocated to the amateur service.

Actually, it's more likely to have been MARINE-ONE... it's only AF-1 if it's an Air Force Aircraft. the Helios used by the President are usually Marine Corps Aircraft.   Same thing applies to Navy-1, Coast Guard-1, etc.

Hello all,
I am looking to get into satellite and I have found (but not yet aquired) a KLM 435-40CX, KLM 2M-22C and a Kenpro KR500 Elevation rotor...

What I need is feedback about each of these. I am just starting out so any feed back would be great!

I have heard that these may have too narrow beamwidth and this may make tracking satellites difficult, can any one comment on this?

I have also heard that if you do not have the space you can remove one section (the end director) and you can shorten the antenna from 19 ft to about 15 feet. While this affects gain a little the antenna is still supposed to perform as well as antennas of this size.

Thanks inadvance folks...
DE KJ6NN
Phil

An EDUCATIONAL EXCHANGE OPPORTUNITY for teachers & kids worldwide!

In commemoration of the 130th anniversary of the PONY EXPRESS a group of riders will be making a venture from the wild west marking the original route of the HISTORIC MAIL RUN.

I received a call yesterday from the ST. JOSEPH MISSOURI PONY EXPRESS MUSEUM that four of the courageous riders will be from CZECHOSLOVAKIA representing their enthusiastic chapter of the INTERNATIONAL PONY EXPRESS ASSOCIATION. Braving some of the original trail on horseback that was covered by young riders long ago the contingent intends to visit SUTTER'S FORT and the PONY EXPRESS STATUE in OLD SACRAMENTO on FRIDAY, JUNE 1ST 1990.

As Sacramento readies for - RAILFAIR '91 - we are reminded of our history and the important parts in communication that the PONY EXPRESS, the TELEGRAPH, and the RAILROAD INDUSTRY each played in it. I have invited this group to visit the COMMUNICATIONS MUSEUM in the historic CALIFORNIA SUPREME COURT BUILDING where we will be wishing them well on their journey and passing "mail" to them of greetings to the CHILDREN of ST. JOSEPH and CZECHOSLOVAKIA on the occasion of their trip and the SACRAMENTO CHILDREN'S FESTIVAL this weekend.

ANY EDUCATORS who would care to join us in congratulating them further on the completion of the journey - June 17th - are invited to forward joint or individual (batch) messages from their students either to me via ELECTRONIC MAIL _or_ TO THE ST. JOSEPH MUSEUM DIRECTLY BY LETTER to meet the group at trail's end at the following address:

Scott Koch, museum display technician
St. Joseph Museum
11th & Charles
St. Joseph, MO 64501

- note: -

At this time we have no address for receipt of Email in St. Joseph or along the historic route. If any users are aware of an Email address of an educator, member of the INTERNATIONAL PONY EXPRESS ASSOCIATION or chapter of the AMERICAN RADIO RELAY LEAGUE along the route or in St. Joseph that might enjoy helping out please contact. (Individual expressions of international goodwill and peace would also be welcome of course.)

I'll post updates as they are known.

Please consider joining this effort.

WA2ISE tried to bypass his 2 meter power amplifier (so his HT could hear on receive) by connecting a pair of 1/4-wave coaxes between input and output with a pair of back-to-back diodes shunting the junction between the two lines.

The diodes do not act as a perfect short when the high-power RF turns them on. Forward conduction voltage is .7 Volts or so peak, perhaps .5 VRMS of fundamental energy, which represents 12.5 Watts into 50 Ohms.

The amplifier will oscillate with all this feedback. In fact, you might be in danger of overdriving the amplifier input with this much power.

Messing with the phase (by changing line length) probably won't help. The phase shift of the amplifier is a strong function of frequency -- achieving negative feedback at one frequency is no guarantee that you won't have positive feedback at some other frequency.

Try replacing the switching diodes with a PIN diode, and run a high DC current through it on transmit. To get enough isolation you might need two diodes, separated by a 1/4-wave line (total of 3 lines). Some people have had success using 1N4004 power supply rectifiers as PIN diodes. Their switching time is slow enough that they work pretty well, and they have good power dissipation.

```
HT ---------------+---------AMPLIFIER-------------+---------- ANTENNA
                  |                               |

                  | coax                     coax |
                  |                               |
                 === 470 pF                      === 470 pF
                  |                               |
                  +-------------------------------+
                  |          1/4-wave coax        |
                 ---                              V
                  ^   1N4004                     --- 1N4004
+12 V             |                               |
on -----RESISTOR--+                               |
Xmit.             |                               |
                 === 470 pF                       |
                  |                               |
               GROUND                          GROUND
```

Sorry for the crude diode symbols. You may need to stick a 1 uH choke in series with the resistor to keep RF out of the +V line. Resistor value might be 120 Ohms, 2W (100 mA thru the diodes).

If the 1N4004's don't work, you might have to use real PIN diodes.

While driving home from work yesterday I had the FM radio on in the car. The band was open a little and I was hearing the usual unusual stations down by Corpus Christi and so forth. Then I hit the "seek" button on the radio and it stopped on 107.something and I heard some kind of Q5 screaming redneck truck dealer selling his wares, "Yeah. We got trucks. All kinda trucks. Big trucks. Little trucks. Pre-owned trucks" (I love that expression "pre-owned") and I was thinking the band must be open toward Beaumont someplace. "We got a great deal on a 1986 F-150. A real beauty. Low mileage. Only $4995!!!! Just take the blah-blah-blah exit off of I-95 and go east." I-95???? "That's at Biscayne (or whatever it was) Ford Truck.

Pretty neat.

I don't know if this counts, but..

I used to hang around with a group of hams who ran several repeaters in town (BTW, are there any other old Gridd Radio Network people here besides myself?). They all seemed to have PA's in their cars, too.

Anyway, the local county government used to have a tape message for rat control that sounded like a friendly phone conversation. The voice was something like an older gentleman, slightly gravelly, and he said something like this:

"Hey there! How're ya doing? Oh, everybody's fine. Except we've got this problem. Yeah, rats. There all over the place. In the basement, in the cupboards. One of them almost bit the baby! Scared the wife half to death. Yeah, I'm going to call the Monroe County Pest Control Board at XXX-YYYY. They'll be ablt to help me.

"Uh-oh, gotta go. One of them's trying to chew up the phone cord. Get outta there!"

We would go to our favorite restaurant/hangout, dial this up on the

autopatch on one of the repeaters, and pump it out the PA. Then we'd go in
and hang around for a few hours, eat, and gab.

Gawd, it's been years now...

With few exceptions (in which cases, the card can become invalid for
things like DXCC - I have a TI9 card that is of this variety - the
operator was 'obviously' padding his pocket), the manager does not
request more than the cost of returning the card. In fact, consider
that, if one sends a manager a SASE with his/her card, then the
manager AUTOMATICALLY is out some money due to QSL card printing.
Admittedly that isn't much, but when you get something in excess of
500 cards per month (as I do), it adds up. Add to that the cost of
replying to bureau replies (the envelopes at the bureau, postage and
cost to send back thru the buro, etc...) NOT TO MENTION THE TIME!,
QSL managing isn't a profitable situation.   (Note...some managers
DO NOT reply to bureau cards, but there is increased pressure from
various ham organizations to do so).

The folks that send a greenstamp for return postage without being
required to do so are essentially 'donating' to the QSL manager's
war chest. I think your point is interesting, but unless required,

the money sent above and beyond the cost of returning a QSL is usually an attempt on that ham's part to keep the Manager from LOSING any more money, rather than 'padding his/her wallet'. As mentioned earlier, of all the DX stations I QSL for, the balance runs positive for only one, that because he is extremely rare, and does some 1000+ contacts a month, often on rare modes (VHF, Satellite, RTTY, etc). The balance is kept near '0' by sending equipment to further these operations. I am more comfortable doing this than 'pocketing' the change, but this decision is my own. I suspect, having been in this arena for some time, that managers are not a profitable function. If you doubt it, try being one sometime!

Paul, the HST PI's have exclusive access to HST data for a year after it's acquisition I believe. This is inline with NASA policy for spacecraft data. This is the reason that no images of the voyager Neptune encounter (except those digitized from NASA Select video by Stanford) have been released to the public (except for press photos). If the PI's choose to release data early, I guess this could be made available.

This is designed to protect scientists who may have waited years for their experiment to fly, and not allow some 3rd party to quickly analyze the data and publish before the PI can. I think this is reasonable, but it certainly can be frustrating. Perhaps it would be possible to get some low resolution bitmaps of press photos released to the public.

Thanks,
Milo

While the K0A etc calls are available for hams, the general rule (last I saw a list of callsign types from FCC) is that in general, these 1 by 1 type calls are used for SPACE stations... so, STS-35 could be assigned A1A, and be in line with the normal callsign assigning rules.

    It would certainly not be a good thing for their network
connection and whatever machine hosted the images, as it would rapidly
be swamped under hundreds to thousands of connections.  Using the
Internet to copy large images merely to satisfy people's curiosity
and/or give them more background bitmaps is not wise.

I've inherited an old Yaesu FT-207 walkie that is supposed to use an NBP-9 battery pack (which it doesn't have). So far I haven't been able to locate any dealer who sells a replacement battery pack. Does anyone know where I might be able to buy one?

Except that A1 is not a valid US prefix. US only owns AA-AL. In fact, a quick glance at my ITU allocation table shows that no ?1 prefix blocks are assigned, except for the countries that own entire first letters (F,G,K,etc.)

Too bad U.K. owns MAA-MZZ. The USSR could have used M1R instead of U1MIR!

Sad, but true. VGA quality GIFs run about 300kB per shot, and the combination of disk saturation and network saturation usually dooms most image sites.

It should be posible for one of the T1 - based NSFNet sites to carry the images, on something like a NET based pc with lots of scsi disk (ala grape). Once the PI exclusion period is over, maybe this will be a possibility.

>Subject: Bypass wire on a power amp module, help needed.
>To: info-hams@wsmr-simtel20.army.mil

>WA2ISE tried to bypass his 2 meter power amplifier (so his HT could hear on receive) by connecting a pair of 1/4-wave coaxes between input and output with a pair of back-to-back diodes shunting the junction between the two lines.

>The diodes do not act as a perfect short when the high-power RF turns them on.

This is O.K.

>Forward conduction voltage is .7 Volts or so peak, perhaps .5 VRMS of fundamental energy, which represents 12.5 Watts into 50 Ohms.

??? What does this mean??? =============^^^^^^^^^^^^^^^^^^^^^

Suppose you wished to have a shunting impedance of 1 ohm, I=.5/1 = .5 Ampere.
Power = .5 VRMS *.5 A = .25 Watt!!! [This might be a problem for the amp!]
For 10 Ohms, The Power in the diode is .025 Watt.
It's real hard for me to imagine a 12.5 Watt, 25 Amp signal diode for .02 Ohm.
You can't have meant that!

Since the impedance of the diodes determine the "I" in the above equation, and the impedance of the diode is driven by the applied voltage and current it cannot be explaned so simply. Still, I agree there is very little current in these diodes. As you might guess from the size of the diode packages used in these circuits.

>The amplifier will oscillate with all this feedback. In fact, you might be in danger of overdriving the amplifier input with this much power.

Probably, NOT the real culprit!

BUT,,, Your missing the point of the 1/4 wave transmission line transformers.
Imagine a Smith Chart...
The diodes receive enough energy (RF) to conduct from the amplifier.
Ths energy is about .5 volt at a small current. Why???
Well it's the magic of the transformer. The low impedance presented by the diodes to the end of the 1/4 wave line is transformed to a very high impedance at the amplifier. The amount of energy actually getting to the diodes is controlled by how accurate the 1/4 wave lines are, and how good the diodes are.
I don't have a chart here, but I seen to remember that 1 ohm shunt get you well over 2500 ohms at the other end of the cable. Assuming a loss-less transformer, the amount of power that can couple into a >2500 ohm load from a 50 Ohm source is what will arrive at the diodes. But nothing like 12.5 Watts.
And we haven't even begun to consider the non-resistive effects of the diodes.

I have built many of these solid state RF switches for "brick" power amps.
The real problem is how good (bandwidth) the coax 1/4 wave line is. What is really needed is a 1/4 wave transformer that only works over "our" band of frequencies. Alas! Reality strikes! As frequency departs from the band of interest, the transformer action produces a very different result. Where the amplifier's gain bandwidth is greater than our desired switch, enough energy at

(typically) lower frequencies now passes unhindered (except possibly by diode clipping) to the amplifier's input. (Check and see if your amp is an oscilator at a frequency other than in the band of choice! If so, there's your problem!)

The other thing not mentioned, is the necessity of dual diodes at the input and output of the amp. These are to isolate the 50 ohm "load" of the unpowered amplifier from robbing your incoming receive signal. These diodes will not see enough voltage to conduct and therefore represent an open circuit to the receive signals.

>Messing with the phase (by changing line length) probably won't help. The phase
>shift of the amplifier is a strong function of frequency -- achieving negative
>feedback at one frequency is no guarantee that you won't have positive feedback
>at some other frequency.

Attempting a "phase change" by varying line length is a BAD idea! First look up how much line you need to even vary the phase 10 degrees! But far more important is the implication of what you are doing to the 1/4 wave transformer. Phase changes end up being made with LOTS of coax and must ALWAYS arrive at odd wave lengths, E.I 1/4, 3/4, 1 1/4, etc.

>Al N1AL

Again, NO FLAME INTENDED, I might be missing something here, but this is my experience and sense of what is happening.

True, but instead of runs of 1s or 0s causing absence of clocking, the user data pattern must be a long pseudo-random sequence with just the right phase. This is MUCH less likely in practice. That's why scrambling is still a very useful and widespread practice.

Has anyone figured out the format of the multi-level fax format for RS232 from the MFJ1278. The documentation indicates that the lower 6 bits of each character represent 3 2-bit pixels. However, as far as I can tell (using a signal generator), individual pixels are meaningless - only the average 6-bit values are real.

Does anyone know?

Even if this is true (I don't know) I doubt they'll be used any time soon.
All of the ham-in-space operations have used the existing callsign of the
astronaut (even though they've all gotten waivers of the Extra Class
requirement) and all of the US-licensed Oscars have also used the existing
callsigns of their licensees. And because space stations are exempted from
ID requirements, most of you don't even know what these callsigns are,
I bet...

The JaBro catalog in front of me lists 2 NiCds available for
the Yaesu FT-207R: a 450 mAH and a 500 mAH, both 11.25 volts.

Keep in mind that Wilson walkie-talkies were made by Yaesu so
you could look for batteries for the Wilson BP-4 also.

The frequencies of the tones are 853 Hz and 960 Hz. They
are broadcast for a period of 23.5 seconds. Hope this
helps.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

Line 2

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
10-11	International Designator (Last two digits of launch year)
12-14	International Designator (Launch number of the year)
15-17	International Designator (Piece of launch)
19-20	Epoch Year (Last two digits of year)
21-32	Epoch (Julian Day and fractional portion of the day)
34-43	First Time Derivative of the Mean Motion or Ballistic Coefficient (Depending on ephemeris type)
45-52	Second Time Derivative of Mean Motion (decimal point assumed; blank if N/A)
54-61	BSTAR drag term if GP4 general perturbation theory was used. Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63	Ephemeris type
65-68	Element number
69-69	Check Sum (Modulo 10) (Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)

Line 3

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
09-16	Inclination [Degrees]
18-25	Right Ascension of the Ascending Node [Degrees]
27-33	Eccentricity (decimal point assumed)
35-42	Argument of Perigee [Degrees]
44-51	Mean Anomaly [Degrees]
53-63	Mean Motion [Revs per day]
64-68	Revolution number at epoch [Revs]
69-69	Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

```
NOAA 6
1 11416U          86 50.28438588 0.00000140           67960-4 0  5293
2 11416  98.5105  69.3305 0012788  63.2828 296.9658 14.24899292346978
```

Note that the International Designator fields are usually blank, as issued in the NASA Prediction Bulletins.

Jim Docke, WB2HBZ, has sent me a message claiming a tie for shortest ham call between my candidate (I5I) and King Hussein (JY1).

I calim to still be winning (on CW), since I5I is just two "dits" away from the shortest possible "letter-number-letter" call - E5E.

73, Bob W3OTC

Ah, the serious technical matters discussed in this group !

Phil KJ6NN asked about comments on the KLM satellite antennas....

They work fine, and beamwidth is about 25-30 degrees effectively (at least on my shortened model, probably less on the full size units). This is by no means too narrow, especially since you will be using an Az-El tracker. Actually, with Oscar 13, you can set it and forget it for an hour or so during the good part of the orbit, as long as you use something like Instant-Track to point it in the first place. During my early bicycle-mobile satellite experiments, I had no trouble pointing using only a compass and an eyeball (pedaling with the things attached was another matter entirely, and caused great guffaws from passers-by, snagged tree limbs, and a bit too much instability for comfort).

Tracking microsats or other low-orbit birds is considerably more challenging, and does require active control on the part of your computer. And in the case of Microsats, a well-designed omni system (like the stacked J-poles described by Dick Jansson in a recent AMSAT news) should work almost as well.

Best of luck, and see you on the birds....

I am thinking about trying HF mobile operation from my 1987 Ford Taurus sedan. I would like to hear from anyone who has successfully (or otherwise) attempted this. Several specific questions I have are:

1. What type of antenna system (mounting) did you use?

2. I intend to operate with output powers of about 100 watts PEP. Did you experience any problems with the electronic control system (fuel injection, cruise control, etc) caused by the transmitted RF? If so were you able to remedy the problems?

3. Is there any noise generated by the Taurus that a good quality noise blanker would have trouble with at HF? If so, any effective fixes?

My current plans are to try to get some sort of an antenna mount built for a hustler mobile antenna (which I already have) that would bolt to the frame similar to a trailer hitch. What ever I do I have to get it done in less than a month (trip planned) so I am hoping to get a jump on any problems by asking for any experiences out in net-land. Thanks in advance for any responses.

About the EBS (Emergency Broadcast Network)....

I worked at out campus staion fall quarter (semester) [WOUB/WOUC -- Athens (ch 20) and Cambridge (ch 44?) in Ohio]. We had the EBS button right there by the Duty Directors console (the guy who does the on-air switching of programs) as well as the audio carts (commonly used in radio for commercials. We use them with slides for quick voice-overs and to fill space when satellite shows end early) for the EBS. There were 2 carts, bright flourscent orange, marked something to the effect of: EBS (0:30min [30secs]) xx/xx/xx [date] Male Voice. "Thermonuclear Announcement". I asked what the heck they were, and was told that they (one male voice and one female voice) were the tapes to be played in event of Nuclear War. Ever curious, I asked what they said. No one knows. It seems only the station manager has ever heard them, and he decided that they are potentially too stress provoking to let anyone else hear.

Some of the DD's there said they dont want to know what they say... but I still want to know, heck, if yer nuked your nuked.... what doesit matter if you know the announcemnt ahead of time! I asked some more authoritative people at the station if i could listen to one of the "carts" in an isolated room sometime and was told "No.".

Does anyone out there know what these say? If so could you email me what is says, or is that illegal somehow?? WHATEVER YOU DO... Dont reply with the actual message to the net!!!!!

I've got a kenwood tr-2400 handheld, but no manual. I desperately need to find out from the schematic what kind of transistor Q11 is.
>>>>

My Instruction Manual says Q11 functions as an AVR using a 2SC2603 (E). At least that's what the block diagram says. The schematic diagram on the next shows it as a 2CS2668 (Y) ?!!   Good luck. If this doesn't help, I have a Service Manual tucked in a drawer somewhere around here. Maybe a third opinion might help!

> to the CB and transmit "Number 20, your order is ready", and watch the fun!

Reminds me of a story....

Don Wallace, W6AM, had a KW rig in his convertable back in the early 1950s.
According to an item I read in an old magazine (CQ? QST?) he used to drop
his wife off at a department store in LA for shopping, and then drive off
and visit a ham store or do some hamming.

The killowatt transmitter got into the store's PA system very nicely on
AM (I don't recall the band). When Don was ready to pick her up, he
would pull up in front of the store and announce, "WILL MRS DON WALLACE
PLEASE COME TO THE FRONT OF THE STORE".

KA9Q used to post AMSAT bulletins on a regular basis. Awhile back I wrote to him and asked if he was going to continue doing it, and he said he was too busy. To get them on the local packet network, I have been calling the BBS in Texas every weekend where they are posted (214/394-7438) and downloading them. From now on I will post them here. I have made some minor changes to clean them up for packet, such as limiting titles to 30 characters, line length to less than 79 characters, and running them through a spelling checker (there seem to be 3 or 4 minor misspellings per week).

I encourage anyone who is on VHF packet to download them from the BBS, or get them here, and upload them to packet. BE SURE to preserve the bulletin IDs (BID$) so that we don't have multiple copies running around the packet network. This should help fill in some of the holes in distribution around the country.

WO-18 STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 153.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 2, 1990
TO ALL RADIO AMATEURS BT

WO-18 CCD Camera Iris Settings Experiments

For the past several weeks WEBERSAT-OSCAR-18 (WO-18) has been sending three to four pictures daily from outer-space. This continuous stream of imaging data has been part of an on going experiment by the students at Weber State University (WSU) to characterize the amount of natural light which enters the CCD camera for the various iris settings. The goal of this experiment is to find the proper settings for the camera iris for a particular light level. This will help considerably in improving the overall picture quality. With the integration of the on-board earth's sensors in the current software, the occurrence of over exposed pictures or totally dark pictures taken when WO-18 isn't earth pointing is no longer a problem. Chris Williams (WA3PSD) says that the painstaking task of manually setting the iris from the ground and observing the results will help software engineers in the future as they continue to understand the CCD camera operation. "The early days of random picture taking are gone," according to WA3PSD. There are 256 possible settings which ground controllers can command the camera iris to; a "zero" setting has the iris completely closed, a "255" setting has it wide open.

What will ultimately come out of this experiment is a look-up table in WO-18's software which will say "for this light level, use this iris setting."

For those wishing to take part in this experiment, WeberWare 1.0 is currently available from the AMSAT Software Exchange. Contact the Exchange at (301) 589-6062 for further information.

WEBERWARE 1.0 USER QUESTIONS

HR AMSAT NEWS SERVICE BULLETIN 153.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 2, 1990
TO ALL RADIO AMATEURS BT

Most Asked Questions About WeberWare 1.0

WeberWare 1.0 is a software program for IBM PCs and clones which will take raw packets from WO-18 and turn the packets into pictures on EGA/VGA CRT screens.

Recently, as more amateurs start to use WeberWare 1.0, the following questions are being asked of AMSAT Area Coordinators about its use:

"Does the TNC [automatically] go into KISS Mode?"
The answer to this no. You must command your TNC into KISS mode by typing: KISS ON. After this, the TNC must be RESTARTed or turned off and back on so that it will actually start to operate in KISS mode.

"How do you store the files? As ASCII"
The picture data from WO-18 comes down as raw binary data, that is, it is not displayable as ASCII characters. As the data is received, your communications program must store the binary packets in a file. Do not be concerned about ASCII telemetry frames which occasionally come down along with the binary packets. WeberWare 1.0 ignores the ASCII telemetry.

"How do you upload a picture to WeberWare 1.0?"
When you store the data from a WO-18 pass, name the file so that its file extension has a ".RAW" and put the file in the same directory in which WeberWare 1.0 resides. After you have invoked WeberWare 1.0 and the main menu comes up, you will see an option for "PACKETS TO PIXELS." Upon choosing that option, WeberWare will give you a choice

of all files that have file extensions ".RAW"

Chris Williams (WA3PSD) of Weber State University (WSU) points out that a complete picture file will take up about 156 Kbytes in a disk file. According to Chris, one can quickly start to run out of hard disk space in a HURRY!

NOMINATIONS FOR AMSAT-NA BOD

HR AMSAT NEWS SERVICE BULLETIN 153.03 FROM AMSAT HQ
SILVER SPRING, MD JUNE 2, 1990
TO ALL RADIO AMATEURS BT

Nominations Period for Three Seats on AMSAT-NA BOD to Close Soon

Nominations are sought for the AMSAT Board of Directors. Directors are elected by the membership for two-year terms. Any member society or group of five members can nominate someone (a member) to run for the position.

This year there are three seats to be filled. Those directors whose seats are up for election are Phil Karn, KA9Q, Tom Clark, W3IWI, and the seat vacated by the resignation of Vern Riportella, WA2LQQ.

All nominations should be sent to AMSAT BoD Nominations, 850 Sligo Ave #600, Silver Spring, MD 20910 to arrive no later than June 15, 1990.

SB ALL @ AMSAT $ANS-153.04
SAREX PACKET HINTS (PART-1)

HR AMSAT NEWS SERVICE BULLETIN 153.04 FROM AMSAT HQ
SILVER SPRING, MD JUNE 2, 1990
TO ALL RADIO AMATEURS BT

You learn very quickly when venturing into the world of Packet Radio that unless you use the correct call sign when attempting to connect to another packet station, you won't get too far. Such is the case with the packet operation on SAREX. A number of publications reported earlier this year that the SSID for the SAREX packet ROBOT would be = 1 (ie: WA4SIR-1). Tom Clark, W3IWI, reports that both the HK21 ROBOT TNC and the operational software for the GRID laptop computer have the calls defaulted to WA4SIR (SSID = 0) and that call should be used unless, for some unanticipated reason, the defaults are overridden. Tom continues, the best advice is for you to MONITOR the downlink signals from STS-35 and use whatever call you see on the downlink. The ROBOT TNC code uses only one SSID at a time.

Because the WA4SIR SAREX ROBOT will be bombarded with signals from tens or hundreds of ground-based users when STS-35 is flying over populated areas, it is not possible for the ROBOT TNC and radio to use normal half-duplex packet procedures -- the CD (carrier detect) signal will simply never drop! The ROBOT will be running in a modified full-duplex mode. When the ROBOT copies a valid packet frame (or when it is time to send a beacon), the data to be sent is put into a buffer and a timer (which is called the FUDtimer) is started. The ROBOT firmware then queues all other outgoing transmissions in the buffer until FUDtimer expires (3 seconds later), and all downlink frames in the queue are sent in one long transmission. You may discover that the response time while running in this mode is sluggish when compared to normal packet operation.

Since the SAREX handheld radio cannot receive when it is transmitting, users should insure that they remain silent and listen when the shuttle is transmitting. In other words, DO NOT RUN FULL DUPLEX ON THE GROUND! Leave your TNC in half-duplex mode (FULLDUP OFF) with CD active just like you do for normal VHF packet operations.
/EX
SB ALL @ AMSAT $ANS-153.05
SAREX PACKET HINTS (PART-2)

HR AMSAT NEWS SERVICE BULLETIN 153.05 FROM AMSAT HQ
SILVER SPRING, MD JUNE 2, 1990
TO ALL RADIO AMATEURS BT

You should be careful with the setting of two of your TNC's timers: DWAIT and FRACK. DWAIT is the time interval after your Carrier Detect light goes out and before your transmitter turns on. You want to make sure your connects requests and acks are contained in the 3 second FUDtimer window. If everybody runs the same DWAIT (like the typical 0.1 - 0.5 second values used for terrestrial packet), then everybody will be transmitting at the same time. Part of the key to your success when uplink QRM is heavy is to pick a DWAIT that nobody else is using! (sort of like picking a lottery number!)

FRACK sets the time interval between your transmissions. After you send a frame, your TNC waits for the FRACK time, and then waits for the Carrier Detect signal to drop, then waits DWAIT, and then tries again. You should make sure your FRACK is at least 3 seconds so that you are not transmitting when the ROBOT's FUDtimer decides it is time for it to transmit -- if you are transmitting at the same time, you will miss any packets the shuttle is addressing to you and you won't have a successful QSO.

Note that your DWAIT (how soon do I transmit?) and FRACK (then how long do I wait?) parameters and the need to stop transmitting so you can hear a reply are just like you encounter when working a DXpedition pileup on HF. If the DX station has a pattern of listening for a few seconds (=FUDtimer) before transmitting, you may have better luck being the LAST station they hear, after the din dies down. The differences are that (1) the ROBOT is a computer and is very predictable and (2) the ROBOT can be working several stations at one time.

[ANS thanks W3IWI for compiling the information for this bulletin]

Note: At press time, the leak problem in Columbia's Hydrogen fuel system had not been resolved and a new launch date had not been set. Usually reliable sources indicated that a launch date before June 8, 1990 was not to be expected and the delays could persist for several more weeks.

AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 153.07 FROM AMSAT HQ
SILVER SPRING, MD JUNE 2, 1990
TO ALL RADIO AMATEURS BT

Transponder Schedule for AO-13 Effective 05MAY90

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130 (Mode S Beacon only)
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

The best estimate of the current attitude is:

BLON = 179 and BLAT = -2.1 for 04 Jun 90

Cross mode B and S QSOs are possible during MA 135 to 140.

AO-10's Mode-B Transponder Now Available for Use:

```
AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination
to support Mode-B transponder operations, therefore, the transponder is
available for general use whenever AO-10 is in view at your location.
Please DO NOT use the transponder if the signals are FMing.  The current
estimate of AO-10's attitude is   LON 24 deg   LAT -9 deg.

Oh come on. Why not just post it?

You have us all curious now.

Heck, I'd be tempted to play them on the air! :-) OK, at least into the
input of the local repeater. Seems to be better than ordering a pizza
(a thermonuclear pizza, now that's well-done).

This isn't one of those jokes that will drive you insane, is it? :-)

Actually I am not radioamateur but DX-listener, but I am also interested
in VHF. It is surprising that there was an Es opening at the same time
in North America and in Europe. Here in Finland I was able to hear on
June 1 1700-2000 UTC and June 2 0500-0700 UTC stations from Southern
Europe in the BC-FM-band 87,5-108 MHz. Most powerful signals from
France and Italy but I also heard stns from Austria, Yugoslavia,
Switzerland and W-Germany. MUF was not very high and sometimes there
were stns only below 100 MHz, the 100-108 MHz part was open for less
than 2 hours.

He may have been using one of the new dual-band radios in cross-band
repeat mode. Say, an HT on 446.x repeated on the 2m repeater input
freq.

REF ham radio and radar detectors

A few years back, I had just turned south on I-75 from I-10 when I was nearly blown off the road by a station wagon with the sign of a real estate agency on the door and Georgia license plates. I keyed up the old tube type two-meter rig on 52 and gave a call, of course not expecting an answer in that particular area. The expected result was, of course, to set off his fuzzbuster. The guy immediately slowed down and got on the CB looking for Smokey. Minutes later, he sped up again and several miles later, I repeated the episode. More calling on the CB and re-adjusting the sensitivity on the detector (he turned the dome light on for this). I slowed down and dropped back, then caught up agian to repeat the senario several times. Finally he turned on the dome light again, ripped the detector from his windshield, and threw it into the rear of the wagon and took off. He lost me at about 75 and accelerating. Twenty miles later I passed him whilst he was in the presence of one of Floridas finest receiving his welcome to the state. Justice triumphs again!

Unfortunately most two-meter rigs don't set off the new detectors today, but J.C. Whitney advertises a radar gun that should do the job nicely, no license required!

Doug,

Unless the rules have changed from last year, NO, BBS and DIGIPEATER contacts DO NOT COUNT. Only direct connects.

>Does anyone know?

If you have the latest ROM Rev, you should have 8 level capability as well
as 4 level. MULTIFAX should be ON, 8LEVEL should be ON. The pixels are packed
two to a byte, and 40H is added to the byte to make it printable ASCII. WEFAX
comes out to 607.5 pixels per line; I usually just drop a pixel every other
line.

If you don't have the documentation on this, call or write MFJ.

For those who believe that QSL managers and the like are simply doing it for
the money, let me remind you that MOST of us do it simply for the enjoyment
and the public service it provides to others. I actually end up putting
my own money into it....although I have to think long and hard before I
continue to send QSL cards and/or post cards to those hams who feel it's
their right to receive QSL cards at another's expense.

I generally send a post card once maybe twice.....after that, their QSL cards go in the trash.

I enjoy sorting QSL cards, but I sure can't say I make any money at it.....

CHEERS!

> between my candidate (I5I) and King Hussein (JY1).

A tie, of course, in # of Roman characters only. In standard Morse spacing, I5I wins hands down (21 units to 49). But JY1 probably breaks through the pileups faster.

Another JY1 tidbit: I was browsing through the '90 CB (I know, it's like reading the phone book, but I was sitting in a pileup anyway) and found that Hussein also has an Iranian call - EP1JY. Hmmm.... Also, I5I is not in the 90 CB, but that's probably not surprising.

Thanks to all for the reply on the EBS tones. I have information I need.

As for the old EBS nuclear annoucements...

Play the cart. It's pretty wild. If they are the ones I remember, those are the carts that used to come with the packet of authenticator words for the validation of the War Warning message. They essentialy tell you to "Be strong" and "listen for emergency information." The scripts were published in Government documents years ago. They are typical Cold War Doom and Gloom material. They have old strident sounding 1950's-type announcers reading the messages. They don't make 'em like that anymore.

They stopped shipping the carts after at least one (maybe two) incidents involving stations accidentally broadcasting the war carts when they were supposed to run the EBS test. One of those incidents caused a panic in the town it was played. Station got in trouble, national press, etc., etc. It's bad enough to be an idiot, but to become a Nationally Known Idiot is really bad. Incidents like that are bound to happen, especially with deregulation allowing untrained personnel to operate broadcast stations.

I work as a board op at a PBS affiliate here in Louisville. We still get the sealed envelopes with the authenticator words in them. When the old envelope expired once, we opened it to see what was in it. There's a red card with a list of words and dates. There are also scripts for use when you get the messages. I think that replaced the pre-recorded carts. I know we just have a test cart in our stack. I'll ask around about the war carts. I'm sure a paraphenalia junkie has one around somewhere. I don't think they'll cause stress, except if they get played when they shouldn't be :-). Talk about your Maalox Moments!

Yours for a better tomorrow!

A variation of the pretend to run a plate trick I have used a few times,
esp when I know they are listening to the radio is throw my tranmitter way
out of tune, and hit the power, and sneak into the early stages of their
amplifier.

It drives speakers faintly when they arn't even hooked up at all.

Also screws up my electronic ignition, set off car alarms, and pay phones
seem to be made to pick up stray RF.

I know it's not a good practice, but driving behind me with your brights on
isn't either.

Air Force One is any aircraft that is carrying the President
crewed by Air Force personnel. A specialized VIP Military Airlift unit
in the Air Force is responsible for this.
The helicopters are Marine Corps helicopters, and I believe
there is a specialized VIP unit within the Corps that takes care
of the helicopters. If he is in the Marines helicopters the aircraft
isn't called "Air Force One," but "Marines One."

Well, I can say from first-hand experience that the Army helicopter
designated for presidential transport is called "Army 1". It hangs
out at Davidson Army Airfield just outside D.C. It's probably the

only Chinook in the Army inventory that doesn't drip hydraulic fluid...

Back in the late 70s the call N6V was issued as a special event call. I think they were broadcasting SSTV pictures from Pioneer or Voyager spacecraft. The main reason I remember it is that they were using some unusual feedline for some of their antennas (nitrogen-filled hardline or something, it's been too long!).

Could earning money in excess of the cost of QSL cards, postage, etc
be considered doing buisness on the air? Just like VE's aren't allowed
to charge more than the cost of materials for exams, couldn't the same
idea be applied? I thought Amateur radio was for enjoyment, not for profit
or extortion in order to get a rare card. Just a thought.

Well, RF Parts wants $93.75 for a matched set of 3 6JB6's, so I don't
think Drake's price is that unreasonable.  Face it, tubes are becoming
scarcer and scarcer, and when that happens prices rise.

I have been trying for a couple of years to download readable wefax charts using the pakrat pk-232 fax option. Up until recently, my attempts have been limited to the Halifax transmissions, and although I was able to generate low quality maps, much of the lettering on the maps has been unreadable. I blamed this problem on noise, and the fact that my antenna is not ideal (50 foot wire making turns through tree limbs and window jams, etc). Recently, however, someone posted information on the re-transmission of GOES wefax on the C band satellite S3-channel 17, so I tried it (ie hooked up hf receiver to baseband out of the satellite receiver). This signal is a strong clean signal, so I figured there should be no problems. The maps I get from this signal are nice clean maps, however again, the lettering (ie temperatures, pressures, etc) seem to be too small to be readable. I am using the highest resolution available on the PK-232 (1900+), and have tried different aspect ratios, but it seems that the maps put out by this service are much more detailed than those from Halifax. ?What kind of resolution is necessary for these maps?! Has anyone (ie the original poster of this info) produced readable maps from this service? If so, what equipment is requirred? I assume that these maps must be the same as what comes off the GOES, and it was my understanding the the pk-232 fax capability was being used by people to get readable maps from this satellite. Am I doing something wrong, or am I just expecting too much from the equipment I have?

Just noticed that some of my message got lost somehow. Here's the rest: But I appreciate all that I get in return. In most cases, I probably won't ever see or hear these people again, and the cards are a lasting reminder ot our one contact with each other.

Subject: Bypass wire on a power amp module, help needed.
Keywords: coax, diodes, how to?
Message-ID: <97457@philabs.Philips.Com>
Date: 31 May 90 15:35:35 GMT
Sender: news@philabs.Philips.Com

Posted: Thu May 31 16:35:35 1990

Last night, I tried to build a bypass wire on a power amp module I have. The module is a brick that amplifies and makes about 7W on the 440 band. Made by Motorola. I put it in a shielded box with heatsink. Works fine, except, of course, the HT driving it cannot 'hear' anything in receive mode. I had heard that a way to fix that is to measure out two lengths of coax, connect one length to the input of the module, the other to the output, and join the two lengths at the far end. Put two diodes from center to shield at the joint, one with cathode on center, the anode of the other on center. (back to back) The idea is to create shorted stubs during transmit (the high RF voltage turns the diodes on), and to give the received signals a path to travel around the module to the HT receiver. I thought that the lengths should be 1/4 wavelength (adjusted for propagation factor of the coax). I tried some HP high speed diodes, and also tried some IN914s.

Tried it, didn't work. Turn on the power to the module, then key up the HT (whose' power level is attenuated to a proper value that the module wants to see). Looking at the amp meter on the power supply, I see current draw go up. then key off the HT. current stays at the same level (indicating that the module is oscillating). Tried connecting the coax at a few different spots (like a few inches away from the module. still oscillates). One thought springs to mind, maybe oscillation happens because the input phase and output phase of the module are in phase, maybe if I insert a half wave length of coax between the module output and the spot where I connect the bypass to make it look like 180 phase might work (something to try tonight).

BTW, the module worked after I removed the bypass. So, I didn't blow it
up! :-)
Is this concept correct, or is there something missing, or wrong?
thanks in advance, 73 de WA2ISE

I also experienced some good sporadic-E effects (I've never seen it this good).

I watched about an hour of CKVR-TV Channel 3, Ontario, Canada, Tuesday evening. I have a Radio Slack fringe-area TV antenna just above roof-level at my house and the Canadian signal was interfering with the signals from Channels 2 and 4 here in the Metromess. The antenna was pointed SSW toward the D/FW antenna farm in Cedar Hill, approximately 50 miles away, as the grackle flies (we don't have many crows here...just those ugly grackles). All I've got to say about the remote station is this: You Canucks get a whole lot better quality TV than the drivel and recycled pablum we get spooned here in the States!

Have you tried MM? It is a package that I got off of a free BB that
my company maintains. I imagine that it is out there lots of places.
It is a good package with little overhead. It consists of a mm.exe
and mm.doc file. It is well enough written so you don't need the
mm.doc file.

I've got a kenwood tr-2400 handheld, but no manual. I desperately need to find out from the schematic what kind of transistor Q11 is.
It says on this transistor:

```
    603
    99E
```

, but so far it has been of no help.
So, help me, if you can! What kind of transistors could be used to replace this one??

"Life's a bitch - and then you marry one..."

I live in the San Francisco Bay Area and have a friend, Mark, who is stationed at Moffett Naval Air Station near where I live. I wanted to visit him one evening at his home on the base, so he arranged to have a guest pass waiting for me at the main gate.

Upon entering the base and driving around for a while in the dark I was totally lost. All the streets looked the same with block after block of standard base housing. "Good thing I'm a ham," I thought, "I'll just bring up the autopatch and give Mark a call." I parked my car at the side of the road and stuck my whip antenna out thru the sun roof. The repeater was in use, so I waited a minute or so for a chance to break in.

Just as I was starting to make my call I noticed that it was getting brighter. Several security vehicles had converged on me and all I could see were spotlights aimed in my direction. I started to get out of my car to explain the situation. Big mistake! I was ordered to FREEZE. I felt that it might be most appropriate to keep my hands on my head. They ordered me out of the car and made me hug a tree while they frisked me. (I guess they thought I was carrying an extra battery pack.) I could now see that several weapons were trained on me.

This was a military base, not your local police and I was starting to get a little nervous. They asked me a ton of questions (it's hard to think when guns are pointed at you) and I answered as best I could. I told them that I held a valid FCC license to use my radio, but that didn't seem to matter. They had obviously captured a spy!

Fortunately a base security officer is a friend of mine and I asked my custodians to please check me out thru him. They also contacted my friend Mark and got his address. I was "escorted" to his house by a convoy of security vehicles-- front and back. The funny thing was that the lead vehicle didn't know where to go either. We would drive into the wrong parking lot and have to turn around. One lot was so small that we all had to back out. After several wrong turns we finally arrived at Mark's house and they had him identify me as his friend and take responsibility for me.

I learned my lesson... Ham radio works! If you're ever in trouble just grab your rig. Even if you don't transmit, help will arrive!

The following antique wireless radio equipment is offered for sale. This collection represents fine examples of some of the first commercially available electronic equipment available to the public. Please contact: Larry Dighera, P. O. Box 12100, Santa Ana, CA, 92712,(714) 842-2862 for details.

RADIOS:

1. Atwater Kent Model 10 "Radiodyne" breadboard. Rare model fully operational with 120V power supply, tubes, owner's manual, and Model M horn speaker. $1,000.00

2. Western Coil Model WC19 "Radiodyne" mint conditon and working. $200.00

3. R C A Radiola III and Balanced Amplifier with tubes. $200.00

4. Priess "Stright Eight" with loop antenna. $185.00

5. Grebe "Synchrophase" excelent condition. $195.00

6. Philco Model 71 "Cathedral". $285.00

7. Philco Model 90 "Cathedral". $495.00

8. Kennedy Model 20 Type 440 with tubes. $175.00

SPEAKERS:

1. Burns curved "petal" horn speaker, sounds great. $250.00

2. Western Electric Model 540-AW paper cone, works. 60.00

3. Bristol Baby Grand hard rubber horn speaker. $55.00

4. Atwater Kent Model "R", rare. $80.00

5. Sonochord paper cone with cloth front, mint, nice. $80.00

6. Music Master wooden horn speaker, nice. $130.00

7. Small Magnavox metal horn speaker, works. $65.00

MISC.

1. F. B. Myers RAC3 "Audion" triode tube new in box. $125.00

2. Tubes: '99's, 01A's,... $10.00 - $25.00

3. Rider Manual I-V Abridged $35.00

4. Rider Manual II $30.00

5. Books ... Fine historical colletcion. Offers accepted.

This one made it up to central VE6 as well. We began to get suspicious after hearing FM BCST stations from San Francisco, Dallas, and somewhere in the southeastern US all fight over the same frequency.

I managed to dash home and fire up the TS-680, but it wasn't too happy to load up my HF dipole :-(I managed to pick up 5 or 6 W6's on CW, however we had a *very* high noise level. Oh well ...

The openings occured on Monday and Tuesday between 1400 and 1630 MDT.
Nothing's been heard here since then.

A solid tone of (I forgot the frequency) for 30 seconds. My understanding is that 'most' of the ebs recievers trigger on 15 seconds of continuous tone.

Sorry that I don't know the exact freq. Seems to me that I had to know it when I took the 3rd class test years ago, see if you can find an old 3rd class Radiotelephone license study manual (you don't need a 3rd class license anymore, so there will be no new manuals :-), they should have the freqs there.

BTW, it used to be 15 seconds (or more or less, I forget) of no carrier, followed by 15 seconds of silent carrier, followed by 30 seconds of tone. (I'm pretty fuzzy on this, it has been a LONG time) It was pretty exciting to be sitting there working the station and have that doggone EBS monitor go off on you. Just about enough to send you through the ceiling, as you got the last 15 seconds of alert tone at FULL VOLUME. Now they only do the 30 seconds of tone.

(I ran an AM station for a few months while in Jr. college, years ago...)

Well, due to our lightning season fast approaching, I am going to be removing my 10m ground plane RSN. Also, there are quite a few house projects which must be done VERY RSN, so it looks like I will not be around during the un-net for a while.

However, lets not let that stop others from getting on 10 before it goes totally dead!

Did you know that radar detectors of the mid 70's could be faked out by 220 fm? Well...while driving down the interstate, wait for a truck to pass and call cq (or something) and the truck slows down *REAL* fast and pulls back into the right lane. You would be amazed how many trucks you can get all lined up behind you on the way to ham fests.

To begin with, I must say that carrying a Motorola MX-360 - (converted to the ham bands) has it's advantages and they're not only technical. It happens to be the "Law Enforcement" industry standard and just having one on you leaves all (including Hams !) baffled as to who you are and whom you work for.
Numerous times in New York City - I've had Patrol Cars pull up to me, assuming I was a street crime unit and asked if I needed any assistance ! (This will often happen in cities too large for government agencies to know exactly who's who). Carrying other HT's such as the small Japanese go-anywhere-do-everything type don't seem to carry as much clout since they don't have much resemblance to the real thing from the standpoint of one who uses an MX3xx 8 TO 10 hours a day.
I carry a two fold wallet with my driver's license on one side and my FCC license on the other. I added a small photo of myself to the top right corner of the FCC license. Since the photo is not actually attached to the license but rather between the license and the outer plastic - I have legally not tampered with the license. The small alteration leaves the wallet looking very official with the FCC Logo standing out very nicely. The few times that I've been pulled over for traffic violations I've handed over the whole wallet when asked to show my driver's license. The fact that I'm immediately called "Sir" in every instance and have never been ticketed might say something. The radio antennas certainly give it more credibility. They don't call Feds "Untouchables" for nothing. - Assumption - is the key word here.
The last cop that stopped me in Brooklyn at 4 AM - asked me if I was aware

that I had just made an illegal U-turn ? As I handed him my driver's license
he caught a glimpse of the radio equipment and clearly heard the "Modat"
signal transmissions (we've all heard that "Brroop- Brroop" kind of
sound before somewhere...) coming from the car.
"Excuse me - why the radio ?" he asked.
"I'm monitoring Narrow-Band FM spurious emissions on the VHF spectrum officer"
he looked at the wallet again and then confided in me by admitting that he
never notices that "No U-turn" sign either when he's off duty.

Hi All!

Since my new Tech license allows me full privileges on the vhf bands I have decided to buy an HT to play with. I have been reading with interest all the recommendations for the various HTs available, but so far I have not seen anyone mention Alinco's equipment. Their stuff seems competevely priced (plus their HTs look good :-)). Is it any good?

Last night I was listening on my receiver to someone on 2m who said he was working through two repeaters. Maybe I misheard, but if I didn't, does this mean that the output frequency of one repeater is on the input of another? Would this mean that every time the first repeater was used, the second would also be operated?

>for that short trip was AF-1 ....

I don't think so; it's true that there are (currently) several aircraft, converted 707s, which can be Air Force One when the President is aboard. However, I seem to recall that the helicopters used by the President are NOT Air Force craft, and are called either Marine One or Army One (I don't recall which service operates the 'copters) when the Chief is aboard.

I would think that you'd have no problems using this cable IF you can manage to obtain and use the necessary connectors. By the way, you should be able to figure out the characteristic impedance using the following formula:

$$Z = 138*(1/SQRT(K))*\log_{10}(D/d)$$

where D is the inner diameter of the outer conductor (shield), d is the outer diameter of the inner conductor, and K is the dielectric constant of the insulator (foam). Typical numbers here are -

Foam polystyrene	1.02-1.24
Teflon	2.1
Polystyrene	2.45-4.0
Polypropylene	3.5-3.6

Note that the dielectric constant of foamed material is *less* than that of the "unfoamed" version.

I used to have a cb in my car, and it came over the intercom at a local burger joint perfectly. My 'neat ham trick' was to go and order my burger, get my order number ("We'll call number 21 when that's ready") then go back to the CB and transmit "Number 20, your order is ready", and watch the fun!

This past Memorial Day, I was coming home on the NYS Thruway and was talking to N2ERX. John said he was using a Un-tanna. It was only 5" tall (or short!). It had a diameter of about 7". He uses it on the trunk of his new car; it has a mag mount and a trunk lip mount.

He also said that it rates as well as, and sometimes better, than the Larsen he also has (I cannot remember if he said a 1/4 wave or a 5/8th wave Larson).

He said he picked it up at one of the areas hamfests. But he did say that it was made in Buffalo, NY. Maybe someone else here has more info.

This one came up on rec.aviation a while back.

Whenever the President is aboard a military aircraft, that aircraft uses the callsign [service] One. The 707 is operated by the Air Force, and that helicopter is operated by the Marines; if he was to use a Navy C-2 Greyhound (AKA COD) to get to a carrier at sea, that would be Navy One, etcetera.

Experience. From the ATC point of view, the helicopter is called Marine-1, the plane is called AF-1. However the crew and support staff usually referred to the plane as 26000 (2-6-thousand) or 27000. These numbers refer to the tail numbers of the planes. One is the real plane, the other is the back up (This info is two years old).

Interesting sidenote: When President Nixon resigned from office, he left the DC area aboard AF-1 before his resignation took effect (1200 08-Aug, I think). However, enroute, his resignation took effect and he was no longer

the President. Therefore, when he landed his plane was referred to as
AF-xxxxx, not AF-1.

I worked N6V, and later received the QSL card. It was for Nasa6Viking, the 6 being ostensibly for 1976. Nice QSL, folded out, and showed the descent to Mars.

My all-time favorite though, was NU3DE. It was a nudist colony in Crownsville Md. And, yes, I did get the QSL from this one too! The operator was Phil, and the front features a family around the ham rig. This one was from the late 70's also. The FCC was more amenable to special event stations back then.

Sony SW-7600 vs. ICF-SW1S

Does anyone know the difference between these two radios?
I have seen a picture of the SW1 and it looks like the 7600.
The specs say that the SW1S is not as good as the 2003.
Is the 7600 as good as the 2003 (sensitivity, etc.)?
Any ideas?
I'm not sure what to buy...

This is of general interest to most radio radio oriented hobbies so
I made it a public response.

RF PARTS
1320 #16 Grand Ave.
San Marcos, CA 92069
(619) 744-0728

They carry mainly RF Transistors, have a good slection of common RF tubes, and can usally special order anything they don't have sitting on the shelf.

They carry tubes from the small 6X4 to the monster amp eater 4CX5000A.

Some books, related equipment and parts. They are part of what is left of Palomar, which basically has split into two divisions, the RF Parts, and a local retail store mainly dealing in CB/10 METER (although they carry other bands, this is what they seem to be geared for...)

I'm not affiliated with them, or anything along those lines, but they have kept me as a satisfied customer so far.

To enable the TS-140S ofor transmitting on all bands:

1. Disconnect radio from power supply and antenna
2. Remove top and Bottom covers
3. Locate the control board (I believe it is on the bottom --NOT BEHIND TH THE KNOBS LIKE THE 440!!)
4. Cut D31 on the control board
5. Reassemble the radio
6. Reset the radio by holding the A=B switch while powering up the rig.

Disclaimer: This Modification is for those who need it to operate MARS only.

The only `prefix-only' call I'm aware of is, of course, King Hussein, JY1. Are there any others? His wife is JY1?? and King Juan Carlos of Spain has his own prefix and his initials as his suffix, EA0JC, but I think he's the only one sans suffix.

What information (if any) is in this transmission? Also, some
local people claim that if you give them some $$, they will make
a modification to your scanner to squelch out that signal--what
do they actually do to the radio?

tnx

Last evening, May 31 U.S. time, there was a good 6- and 2-meter Es opening.
The 6-meter opening didn't have anything RARE from here in W3, mostly 5s.
The big event was an hour of loud 2-meter sigs from Texas and Oklahoma. I managed to p;ick up a few new grids.
An attempt to DX on the FM BC band failed as usual. The 50+ local stations don't allow much chance to hear DX.

What did you hear?
Bob W3OTC
(The June 1 refers to the fact that the 2-meter opening started about 0005 UTC June 1.)

>.....I agree....

     From a vaguely recalled article (maybe in Smithsonian?): [service]1 is the call used by an aircraft _with_ _the_ _president_ _on_ _board_. The usual

White House shuttle is a Marine chopper, hence, Marine 1. There exists an Army 1. When the same a/c does not have the president on board, it has a conventional callsign (forgotten...). If one of the back up planes is in use, by the president, _it_ assumes the [service]1 callsign. They recounted Nixon flying to California after resigning. Someplace in midcontinent, the a/c stopped answering Air_Force1 and started using a conventional call.

I became a HAM last year. About 6 weeks after I got my license it paid for itself. A group of college age kids from our church went North here in Michigan to do some water skiing. One of the kids who went along has had medical problems (Epilepsy) but hadn't had a fit for about 5 years. He came along and was enjoying the day. After getting done skiing he was lying on a towel and went into a fit. There were no telephones for quite a ways (2-3 miles) from the place we were skiing. This would have been a long run. I called out on the local repeater frequency (I didn't know how to use it's autopatch -- or if they had 911).   A local ham called the ambulance and it arrived it <5 minutes. Definitely saved the day and helped our friend out.

Frankly, this one incident was enough to make getting my license worthwhile.

Hi!

I would like to thank everyone who replied to my request for help. Their advice was very much appreciated and as a result of it, I have decided to go ahead and erect a vertical antenna (a Cushcraft R5) on the garage.

I tried to reply to everyone who sent me email, but our mailer went down in a big way and I did lose some mail. The amount of advice and encouragement I have received from hams everywhere never ceases to amaze me. I am now looking forward, more than ever, to getting on the air.

Thanks again,

Andy Greenshields [dxandy@widener.BITNET]

I tried mail, but it bounced. The answer is probably of general enough interest. The U.K. recip licence costs 12 pounds Sterling, and is good for 2 months if mobile, 1 year if you supply a U.K. station address. Third-party traffic is prohibited.

Since David just passed his exams, there may be bad news -- you have to be General or above for the reciprocal priviliges. A Technician license isn't good enough.

For some reason every time there is a DX contest the E/H wave eaters
show up. Some time the geo-magnetic conditions get so bad that I can't
even hear myself think --- Now that's real bad. I know that others
live in QTH's which have the same difficulty. That is why I asked about some ideas
on a FAIR INTERNATIONAL DX CONTEST which would
account for band conditions as well as the station ERP. I guess
I could move but then who would be here to give all you guys the
VE5 prefix for the SS/Sprint/WPX contest. Oh well I guess no matter
how much I spend on rigs/towers/antennae the protons/electrtons
which swirl around up here are going to win any way!
See you all in the next contest .... provided the God's are in a good
mood.
PS. I am moving my QTH in the fall to the south of England. I am
going to take a QRP rig with me but I expect that I will only have
some bedsprings for an antenna. At least I will be able to experience
conditions from another QTH.

I don't agree with this sentiment. I don't see this as a deception; I see it as economy. When I send cards to a manager overseas I include: QSL cards (average of two or three), compensation (a green stamp or two IRCs; IRCs can be had for $0.40 on the secondary market) and a return envelope. I try to view this as a fixed expense for getting cards from overseas. Want a card? Send a buck.

What's wrong with making those incoming dollars go a little further? They can be used to buy QSLs, or reply to bureau cards. (QSLing via the bureau is not gratis in every country like it is here .. and face it, $2 per pound of outgoing approximates free.) The money can be used to pay DXpedition bills. What's wrong with spending your money wisely?

For example, if it cost approx. $US 0.80 to send cards from Finland, but only approx. $US 0.60 to send them from Sweden, would you be irate if they drove over to Sweden and sent the cards? I wouldn't.

Where I draw the line is when DXpeditioners expect me to foot the cost of their DXpedition. I don't go for the "I'm doing you a favour by going on a DXpeditions so you can work a new country. You owe it to me to help pay the bills." Bzzzzzt. WRONG. You're going on DXpeditions because you derive personal satisfaction from this kind of activity (in the form of recognition from your peers, you enjoy travelling, you enjoy the challenge, whatever).

I used clear Krylon at one time and discovered that it came apart pretty badly after a little while, presumably due to UV exposure but I never proved that was the cause.

I've been building and measuring vhf/uhf antennas for quite a while and I often use brazing rod for elements and copper water pipes for the boom. One of the subtle problems that can occur with such construction is due to corrosion, oxides sulfides and I don't know what all, building up on the elements if they are not protected. This has the insidious effect of reducing antenna efficiency without showing up in the pattern. Essentially the gain drops on both transmit and receive and unless you have a known good reference antenna you may not even notice it! (It's a little like the budget deficit (:>) Everything appears to be "normal".

I have had good results with standard spray paints. I don't remember the brands, but I've seen no problem as far as changes in feedpoint impedance before and after spray painting, I've measured quite a number using a vector network analyzer. The finished (painted)antennas have appeared to have the correct gains for their number of elements/boomlength. I can't say that I ever tried camoflouge paint but I don't expect that would fool the electrons (:>).

I can't think of any cases in which having a radio has gotten me out of a real jam (except for the one time I ran out of gas), but I *can* cite one case in which it almost got me INTO a serious jam.

It was about 9 years ago, just after a USENIX conference. I was taking the San Francisco BART across the bay to visit a friend at UC Berkeley.

I had all my luggage with me, and my 2m HT was sticking out of my coat pocket. As I gazed out the window at nothing in particular, I noticed from the reflection in the window that the guy sitting on the other side of the car was counting out pills into the palm of a young girl's hand. This surprised me, and before my better judgement could prevail I reflexively turned my head and looked directly at the guy to see if I saw what I thought I saw.

Yes, this was indeed a mistake. He saw the radio and antenna sticking out of my pocket and apparently took me for some sort of narc or cop: "Hey, what YOU looking at?" All I could do was to turn back to the window and ignore him as best I could, wondering if I'd be alive at the next stop. I stared outside until the guy finally got off at the Oakland stop. He continued to harass me through the window (he apparently didn't like the way I looked right through him) until the doors closed and the train began to move. At this point, I couldn't help myself; I broke into a wide grin and gave him the biggest obscene gesture I could muster.

Since I moved to the NNJ/NYC area about 8 years ago I have ridden the NYC subway many times, but never have I been as concerned for my personal safety as I was that night on the SF BART. But when I carry my HT, I usually hide it under my coat.

Phil

THE ARRL LETTER - Volume 9, Number 10 - May 18, 1990 - Part 1 of 4

BOARD TO HONE CODELESS LICENSE STAND

League officials met recently to consider the ARRL position on proposed changes to the Amateur Radio licensing structure. The "strawman" committee, appointed by President Larry Price, W4RA, on recommendation of the Executive Committee, was charged with weighing the League's position in light of the FCC's Notice of Proposed Rule Making on the subject (for the full text of PR 90- 55 see April QST page 38).

The League's board of directors now actively seeks input from all interested members. The board will consider this input, as well as the recommendations of the April 21 working group, to formulate a position.

The "strawman" committee consisted of five directors, First Vice President George Wilson III, W4OYI, and Executive Vice President David Sumner, K1ZZ. Among their recommendations to the board:

* Reaffirmation that the Novice class license as a route of entry into Amateur Radio is absolutely essential.

* Support for the incorporation of Novice testing into the accredited Volunteer Examiner system. This would permit examination elements earned in obtaining a Novice license to be used for credit toward upgrading, without retesting.

* Pursuing rules changes to permit VECs to recoup examination expenses for Novice exams, provided that no fees are charged for any applicant under age 16.

* Retention of the Technician class license as a distinct class of amateur license, and its continued availability to new applicants.

* Clarification of the League's position with regard to Element 3A: that the existing Element 3A should be expanded by five questions (i.e., the pool should be expanded by 50 questions). Requirements for the Novice, Communicator, and Technician licenses would be as follows:
    Novice: Elements 1A (5-wpm code) and 2 (30-question written);
    Communicator: Elements 2 and 3A (30-question written);
    Technician: Elements 1A, 2, and 3A;
    Upgrading from Novice to Technician would require passing Element 3A;
    Upgrading from Communicator to Technician would require passing Element 1A;

* Certificates of Successful Completion should be issued to candidates who pass either Element 1A or Element 2 without qualifying for a license by passing another element;

* Frequency privileges for Communicators should be as proposed in RM-6995 (the League's original codeless license proposal). The FCC proposal of a 200-watt PEP output power limit for Communicators was acceptable to the working group. However, since the only difference between Communicator and Technician qualifications is the 5-wpm code test, the Committee could find no rationale for denying Communicators control operator privileges for repeater and auxiliary stations. Therefore, the Committee recommended the

Board reconsider its position on this matter;

* Technician licensees who have credit for Element 3B by virtue of having taken the old, 50-question Element 3 examination should retain this credit (permitting them to upgrade to General upon passing just the Element 1B 13-wpm code test);

* In all other respects, the committee recommended there be no departures from the ARRL position as adopted in RM-6995. The recommendations of the committee are just that--recommendations.

AWAITING "THE NEW CQ"

Subscribers to both CQ and Ham Radio magazines eagerly await the July issue of CQ, for the first indication of how CQ assimilates Ham Radio.

"[Ham Radio readers] can expect to see the best of what is good in the magazine you already know molded into an even better product," says Ham Radio publisher Skip Tenney, W1NLB, in the June--and final--issue of HR. "The expanded CQ," Tenney says in his final editorial, "will incorporate the best efforts of two of the most experienced publishing staffs anywhere in the Amateur world."

CQ, in an April 27 letter to advertisers, says "we'll be looking at a new circulation figure of just over 100,000. That includes newsstand sales of 32,500..."

CQ's advertising rates also are rising, by "less than 30 percent" (their letter stated).

While organizational planning is still "in the formulative stage," as one of the principals puts it, CQ will waste no time addressing the task of retaining former Ham Radio readers.

Articles accepted for publication by Ham Radio will not necessarily appear in CQ. Their authors were given the option of taking their work elsewhere or automatically letting CQ consider them.

As for staff, no immediate changes have been announced at CQ. Ham Radio assistant publisher J. Craig Clark, NX1G, will remain in New Hampshire, to manage the Ham Radio Bookstore and to "develop new properties."

THE ARRL LETTER - Volume 9, Number 10 - May 18, 1990 - Part 2 of 4

TWO BLOWS STRUCK FOR 220

The Federal Communications Commission continues to consider ways in which the 220-222 MHz band might be used for non-amateur communications, while amateurs still occupy the segment and in spite of the matter being under appeal in federal court. Recent FCC proposals have given the League two more opportunities to remind the Commission that "action to implement the band in the Part 90 rules is premature, and subject to reversal by the Court."

"Bait and switch" is how ARRL General Counsel Christopher Imlay, N3AKD, referred to land mobile industry comments in FCC's PR Docket 89-552, in which it is suggested the Commission group the proposed 5 kHz voice channels into contiguous blocks of five or ten channels, and to permit time division multiple access (TDMA) schemes for data transmission.

In his Reply Comments, Imlay points out that the 25- or 50-kHz channels proposed by industry for 220-222 MHz in the name of "spectrum efficiency" already are available in existing land mobile bands.

"...the entire rationale for the reallocation of the 220-222 MHz band...is now gone ... It is time that the Commission reevaluated the premises which led to the reallocation of the 220-222 MHz band," the League's comments contend. "The conclusions in Docket 87-14 were never correct, and have been shown...to be untimely."

In PR Docket 89-599, FCC in December proposed a "Personal Emergency Locator Transmitter System (PELTS) within the 220-222 MHz band. In comments last March the League pointed out:

* The proposal was premature;
* Rules compliance would likely to be poor;
* Few non-amateurs have receivers for those frequencies--most scanners don't cover them.

The League, in its most recent comments on the matter (May 4), noted that professional search and rescue organizations also saw PELTS as unlikely to be effective, especially in light of the ongoing development of satellite locating systems and of the burden that would be imposed on users to acquire new equipment.

ARRL comments again concluded by seeking "no action" on the PELTS proposal, particularly in light of the uncertain status of the actual reallocation of the frequencies involved.

FDA ISSUES RF ADVISORY

A recent US Food and Drug Administration advisory concerning infant apnea monitors mentions their susceptibility to RF fields, but the risk appears to be minimal, according to experts.

The FDA Drug Bulletin (Vol. 20, No. 1) urges health care professionals to ensure proper setup and use of the monitors. The devices, used primarily to detect cessation of breathing, are used in both hospitals and in homes. The hospital units are more sophisticated than portable devices used in the home.

Infant apnea monitors are hooked up to a child by gluing two wires to the chest; the monitor detects changes in impedance across the wires, setting off an audible alarm. IA monitors are primarily subject to false alarms; fail-safe mechanisms in their microprocessors virtually ensure they will detect episodes of apnea.

The FDA safety alert letter mentions a number of possible flaws in set-up and use of IA monitors; among them:

- "Keep the monitor away from possible sources of interference such as electrical appliances"; and

- "Be aware that strong radio signals from nearby TV or radio stations, airports, ham radios, or police stations could interfere with the monitor, and check for this interference if the monitor is to be operated in such areas."

A biomedical technician contacted by The ARRL Letter said he has experienced not a single incident of an IA monitor interfered with by an RF field. The technician, who maintains the monitors for a home health care company, does say that older units, using analog technology, can be susceptible to all sorts of electrical interference.

Static electricity affects them; "You can get a false alarm by running your hand over the case of an older unit," he said. "A device with a compressor--a refrigerator or air conditioner--on the same circuit can cause a false alarm via a voltage spike."

On the other hand, every instance of failure the technician knew of was due to incorrect usage. His company recommends parents perform a power-up test every time their IA monitor is used.

Copies of the advisory letter are available from FDA, HFZ- 240, Rockville MD 20857.

THE ARRL LETTER - Volume 9, Number 10 - May 18, 1990 - Part 3 of 4

FCC ENFORCEMENT ACTIONS

On 1 April 1990 Amateur Radio operator Joseph A. Della Barba (N3HGB) of Annapolis, Maryland was fined $1000 for "operating a pirate radio station," according to an FCC public notice. An electronics technician and engineer from FCC's Baltimore and Laurel offices located the operator transmitting on radio equipment in his vehicle.

The unauthorized station, using the call sign WTNU, ("The Nation's Underground") had been initially overheard during routine monitoring of the aeronautical mobile band. Della Barba was operating on 25,000 kHz, a frequency assigned to the National Bureau of Standards station WWV. (FCC Public Notice 13 April 1990).

Acting on a tip from a "local amateur radio operator," FCC's Seattle Office identified and fined one George M. Muchin for unauthorized and unlicensed operation of a marine radio transmitter. According to the FCC, Muchin, owner of Redmond Plumbing, was fined $1500 for using 156.575 MHz, a VHF marine frequency, for conducting non-marine business. Mobile direction finding equipment was used "to trace the transmissions first to a worker's truck and then to a private residence." (FCC Public Notice 30 April 1990).

Following several years of complaints by amateurs operating in the 40 meter band from the Pacific Northwest, FCC has tracked down and fined two amateurs for "willfully interfering" with other amateur radio communications. Robert N. Frizzell, W6UCB, of Beatty, Ore., and Richard L. Young, W6UGH, of Los Angeles, each were fined $1000.

FCC personnel observed Frizzell and Young "consistently operat[ing] adjacent to the operations of other amateurs and within the bandpass of state of the art receivers. When the affected amateurs moved, these two amateurs would follow and operate adjacent to them, again within the receiver bandpass of adjacent operators."

The case has been referred to FCC in Washington. (FCC Public Notice, 30 April 1990).

A licensed amateur has been charged with jamming a commercial broadcast satellite, according to the FCC. Thomas M. Haynie of Virginia Beach, Va., has been indicted by a grand jury in the Eastern District of Virginia. Haynie was charged with three counts of intentional interference and three counts of unlicensed operation of a satellite uplink.

Haynie, WB4PVK, is 38 and holds an Advanced class amateur license, according to FCC records.

On September 6, 1987, the indictment alleges, Haynie was uplink operator on duty at the Christian Broadcasting Network facility in Virginia Beach. On three separate occasions a video text message "completely overrode" programming carried on two satellites: Satcom IV and Spacenet I. The programming allegedly jammed was that of The Playboy Channel. (FCC News, 27 April 1990).

IARU PRESIDENT HONORED

International Amateur Radio Union president Richard L. Baldwin, W1RU, has received the Roy Stevens, G2BVN Memorial Trophy for service to international Amateur Radio. The triennial honor was unanimously awarded to Baldwin at the IARU's Region 1 conference, held last month in Spain.

Baldwin joined the ARRL Headquarters staff in 1948, served from 1975 to 1982 as general manager, and was an IARU representative at the general WARC in 1979.

Baldwin recalled his job interview at ARRL Headquarters 42 years ago. "When asked about my qualifications, by General Manager A.L. Budlong," Baldwin said, "I replied 'I'm reasonably intelligent and I can type.'"

"Anybody can type," Budlong replied. "So what's your code speed?"

THE ARRL LETTER - Volume 9, Number 10 - May 18, 1990 - Part 4 of 4

TOWARD AN INTER-ISLAND ACCORD

Using Hurricane Hugo as just the latest example, Caribbean communications officers met recently to continue plans for cooperation in times of need. Their goal, to join in a "regional mechanism," would include relaxing third party restrictions, facilitate reciprocal licensing, and ease customs barriers between islands.

Amateur Radio representatives from 11 Caribbean nations met on St. Lucia in late April to discuss these issues. Included were Trinidad and Tobago; Grenada; St. Vincent; Barbados; St. Lucia; Dominica; Montserrat; Antigua; St. Kitts and Nevis; the British Virgin Islands; and Jamaica.

Meeting under an umbrella organization formed in 1980, the Pan Caribbean Disaster Preparedness and Prevention Project (PCDPPP), comprised of 33 Caribbean and Central American islands and countries, the group focused on presenting a collective front to regional governments and agencies, specifically the Caribbean Telecommunication Union.

Attending as observers and resources were Office of US Foreign Disaster Assistance communications officer Art Feller, KB4ZJ, Texas A&M telecommunications professor Pierre Catala, WA1UAT, and ARRL Field Services Manager Richard Palm, K1CE.

According to Palm, PCDPPP seeks to improve the dissemination of warnings as well as all communications in the event of a natural disaster such as Hugo. The strengthening of Amateur Radio bridges joins commercial telecommunications networks as part of the plan. For this reason, Palm says, the PCDPPP has worked closely with the region's amateur community, including sponsoring the late-April conference.

Several of the participants reported conducting emergency drills on their islands, and most are developing the use of packet radio.

Regularly scheduled nets, such as the twice-daily Antilles Emergency and Weather Net, also play a part in disaster communications. The conference agreed to promote greater participation in such nets and to encourage continued association of such nets with IARU, ARRL, and the Amateur Radio organizations of member countries.

Three conference working groups, Technical, Organizational, and Emergency Procedure, made recommendations to the overall conference, which agreed to form a new Amateur Radio regional organization. To that end a task force was formed.

At the conference, Palm noted the League's work to educate US amateurs in proper techniques during Caribbean emergencies, based on lessons learned from hurricanes Gilbert and Hugo and from Palm's meetings with Caribbean amateurs in Trinidad and Jamaica.

W1AW RENOVATION UPDATE

Contributions to the Maxim Memorial Station renovation continue to arrive, from manufacturers as well as private individuals. The station, rededicated last July, is nearing completion (as if a ham station is ever complete, or permanent!), with some antennas yet to go up, according to W1AW station manager Eddy Pollock, W6LC.

Last week W1AW was the beneficiary of two Tandy 1000 TL/2 computer systems, through the auspices of Ed Juge, W5TOO, marketing director for the Tandy Corporation. These computers initially will be used--in conjunction with a Buckmaster CD ROM call sign data base--for record keeping and QSLing at the station, as well as for visiting operators to use in log keeping.

Tandy's gift, valued at some $6000, adds their name to a list of corporate supporters of the station that includes Andrew Corp., Bencher, Cushcraft, Digital Radio Systems, Hammond Mfg., Harris Corp., ICOM America, Kenwood USA, MFJ, and Ten-Tec.

Three plaques soon will be on public display at the station, listing individual donors at the $1000 and $500 levels, as well as recognizing corporate supporters of Amateur Radio's most famous station.

SAREX ON HOLD

The launch of shuttle STS-35 was aborted May 15 and postponed until month's end, at the earliest. STS-35 will carry WA4SIR and the SAREX (Shuttle Amateur Radio Experiment).

I was wondering if anyone knows if it is still possible to get the
TNC2 from TAPR as a kit. Or if not, where to look for the cheapest
TNC2 with Kiss support?

I have a need for a number of inexpensive basic TNCs. Some friends
of mine are interested in setting up a packet network in New Guinea.
They are missionary language translators and have very limited budgets.
Most do have portable pcs.

Any help with acquiring information would be appreciated.

A friend and myself are struggling along trying to prepare for our novice/tech test this July. I got a copy of 'morse tutor' for our computers and I've been doing quite well with it. My friend however says he just isn't picking it up. Does anyone out there have any experience learning code from software like this and what is the nets advice on how to use it. I have been running the teach mode for the group I'm working on for a few minutes, the going to test mode until I make a mistake. I then resume teach mode again for a few minutes.

I'm interested in how others have successfully used these tools.

Thanks,
John R. Schuch
(maybe in a couple of months I'll be able to put a call in my .sig)

In article <12012@shlump.nac.dec.com> koning@koning.enet.dec.com (Paul Koning) writes:
]> If the data is scrambled properly, it is virtually assured of self clocking.
]
]That's a common misconception. Scrambling has no effect on whether
]a code is self-clocking. All it does is change WHICH user data pattern
]causes absence of clocking.
]
]Unfortunately this mistake is common in certain parts of the communication
]industry. The reality is that the ONLY way to have guaranteed clocking is
]to use a code that has minimum transition density guarantees. For example,
]FDDI is self-clocking; SONET is not.
]

On the other hand, scrambling can be used for self clocking for most
communications schemes. For example, if you can stand the loss of
clock for 20 bits, then the probability of losing clock because
you didn't GUARANTEE clocking is about 1E-6 - probably better
than your BER anyway. This assumes:
  (1) You are receiving and sending crystal controlled (I can't imagine
      doing it any other way.
  (2) You design your clocking so it can miss clocks and not do anything
      silly.
  (3) When a packet is retransmitted, it is not scrambled the same as
      when it was first sent (again, any normal scrambling modem
      will act properly in this regard).

So... from a perfectionist standpoint, scrambling won't work. From
any practical engineering standpoint (except perhaps in extremely
low SWR FEC/no-ACK protocols), scrambling will work just fine.

Damped Wave. - From the description of the oscillatory discharge of a condenser, a clear understanding of the damped wave is obtained. The word "damp", as use in connection with a radio wave, means to choke or to stifle, to die out. The damped wave is choked off or stifled, according to the characteristics of the circuit in which it is oscillating. ...

DOVE STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 118.01 FROM AMSAT HQ
SILVER SPRING, MD APRIL 28, 1990
TO ALL RADIO AMATEURS BT

On the AMSAT-NA Operations Net of 22 April 90, Microsat command engineer Bob McGwier, N4HY gave a brief rundown on the current status of the BRAMSAT Project DOVE satellite. After a DOVE CPU crash in March, the primary transmitter (on 145.825 MHz) was locked on in a condition where no data was being transmitted. Routine commanding of the spacecraft was impossible. Eventually, with the help of the moonbounce array at W5UN and fortuitous circumstances, the CPU was reset and control was regained. On the following day, the two meter transmitter was turned off and the experimental S band transmitter was activated as the only downlink during an interim recovery period.

A decision was made not to resume any DOVE operation on two meters until a new software load could be accomplished. This meant that return packets from the Microsat Boot Loader (running in onboard ROM) would have to be recovered from the S band transmissions. DOVE's owner, BRAMSAT President Dr. Junior DeCastro, PY2BJO, provided N4HY with an S band receive converter and antenna system to be used in the recovery effort. When this equipment was installed at N4HY, Bob was able to verify what other S band receiving stations around the world (including ON6UG, K0RZ, and KF4AU) had already discovered, that the phase shift keying modulation index on the transmitter was much lower than expected. Simply put, the binary data does not shift the S band carrier a full plus and minus 180 degrees as it had been designed to. Listening on a sideband receiver, the signal sounds like mostly carrier with data only at a low volume. Additionally, data being sent via this transmitter is from the MBL which transmits incomplete telemetry packets, and those only infrequently. Command stations have experience with this data format, but it cannot be decoded directly by regular TNCs so it is difficult for other operators to participate in data collection though they may have S band gear.

Since the reset, it has been determined that DOVE is in a safe and stable condition running the MBL firmware. N4HY has developed a DSP based technique to decode with some certainty the undermodulated packets returned on DOVE S band during software uploads. He expects to be able to load and verify a new operating system on DOVE with some difficulty and then resume 2 meter transmissions. A full recovery is expected.

During the time required to get the S-band receive gear and demodulation techniques developed, work has been proceeding on the first, rudimentary PBBS systems for LUSAT and PACSAT. After these systems are installed and in use (very shortly), full attention will be concentrated on the DOVE recovery.

AMSAT-NA and BRAMSAT recognize the popularity of DOVE and regret the inconvenience that these startup delays have caused to educators and other amateurs worldwide who are anxious to see DOVE begin its operational mission. It is, of course, imperative that all facets of spacecraft checkout and operation, including this first crash recovery, be done thoroughly and with the utmost care.

PROJECT OSCAR MEETING REPORT

HR AMSAT NEWS SERVICE BULLETIN 118.02 FROM AMSAT HQ
SILVER SPRING, MD APRIL 28, 1990
TO ALL RADIO AMATEURS BT

Future Plans Made During Project OSCAR Meeting

Project OSCAR's Executive Committee met on April 22 and has set forth on a number of new projects. Among the items covered was renewed interest to again produce the Project OSCAR Orbital Prediction Calendar Book. The purpose of the orbital prediction book is to provide simple and inexpensive tracking information to anyone interested in the low orbiting satellites such as Microsat, UoSAT, Fuji and the Radio Sputnik series of amateur satellites.

It was determined that Project OSCAR members would like to participate in future satellite projects. Therefore, the Executive Committee will be submitting thoughts to the group meeting in Marburg, West Germany in May, discussing ideas on a Phase IIID satellite.

Project OSCAR will look to develop a Mode S receive system from available (and cost effective) modules now available on the market. Project OSCAR members will complete this project and write up a description of the system for publication in the Amateur Radio media so that anyone interested in Mode S will be able to make the move into this new area of OSCAR communication.

Finally, in response to many who have asked for information, Project OSCAR will sponsor a seminar about operating on all of the available Amateur Radio satellites. This seminar will take place on September 29th and 30th on the San Francisco Peninsula. In addition to a full schedule of talks aimed at the beginning and advanced satellite user, there will be demonstrations available, plus published papers provided to all in attendance. Complete details of this OSCAR seminar, along with names of the speakers scheduled to speak will appear in the AMSAT bulletins, on Packet and phone BBS', and the usual Amateur Radio Media. To receive complete registration information as soon as it's available, send a Self-Addressed Stamped Envelope (SASE) to:

OSCAR Seminar
Project OSCAR, Inc.
P. O. Box 1136
Los Altos, CA 94023-1136

[ANS thanks Project Oscar President, Ross Forbes, WB6GFJ for the information for this bulletin.]

UO-14 UPDATE

HR AMSAT NEWS SERVICE BULLETIN 118.04 FROM AMSAT HQ
SILVER SPRING, MD APRIL 28, 1990
TO ALL RADIO AMATEURS BT

New Bird is Hot Bed of High Speed Data Activity

The level of activity at 9600 baud on UO-14 demonstrates that it is relatively easy to become operational at that speed. A complete list of stations logged on the UoSAT-OSCAR-14 MHEARD list over the last week includes:

DF3LZ, DF5DP, DG3LAE, G0BDD, G3RUH, G4WFQ, G8TZJ, GM4IHJ, I2KBD, JA6FTL, JH1LVN, JH3FDA, JH7CKF, JR1EDE, JR1FRF, KA2MOV, KF4WQ, LU1BEE, LU8DYF, N4HY, ON6UG, VK3DTO, W7KRC.

It was reported that KA2MOV was able to connect to N4HY using 25 watts on transmit and omni-directional antennas for both transmit and receive.

UO-14's command team are planning to load increasingly sophisticated housekeeping software to the PCE this week. The new housekeeping software includes a "file system" for storing WOD and data frames from the Cosmic Particle Experiment (CPE). This data will be downlinked using the standard PACSAT Broadcast Protocol, inside AX.25 UI frames.

Once the housekeeping software is installed, Jeff Ward of the University of Surrey will begin working on the BBS software. This will be a host-mode BBS designed by Jeff and Harold Price, NK6K, specifically for the PACSATs.

[AMSAT thanks AMSAT-UK for the information for this bulletin]

AO-13 OPERATING SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 118.05 FROM AMSAT HQ
SILVER SPRING, MD APRIL 28, 1990

TO ALL RADIO AMATEURS BT

AO-13 Transponder Schedule to 09May90

Mode-B : MA 000 to MA 165
Mode-JL : MA 165 to MA 195
Mode-S : MA 195 to MA 200
Mode-BS : MA 200 to MA 205
Mode-B : MA 205 to MA 256
Omnis : MA 240 to MA 060

BLON = 208 and BLAT = 0.1 for 30Apr90

Only the Mode-S transponder andd the Mode-B beacon will be ON from MA 195 to MA 200. Beginning in early May, there will be a transponder and attitude change on AO-13. During magnetorquing to BLON/BLAT 180/0 the transponders will be switched off from MA 200 to MA 060. After the attitude change, a new schedule will be announced.

AO-10 is currently experiencing poor solar panel illumination angles and until further notice its transponder is not available for use. It is expected that this will continue for several weeks.

Radio Amateurs Show Great Enthusiasm For MICROSATs At Dayton Hamvention '90

At this year's Dayton Hamvention, many thousands of radio amateurs were exposed to the radio amateur satellite service and AMSAT. During the world famous event in which over 35,000 hams participated, over $21,000 was donated to AMSAT. This is taken as a significant expression of support for the MICROSATs and AMSAT's SAREX-II activities. In addition, over 190 hams either became new AMSAT members or renewed their existing membership.

Throughout the weekend, there was always a major traffic jam in front of the AMSAT booth as the friendly AMSAT volunteers worked to answer questions and provide information. All of the volunteers (AA0P, WD0HHU, VK5AGR, N4HY, W5IU, KO5I, W1XT, W3IWI, WA4GSS, K8QKY, K8MU, WA3GOV, WB2IBO, N2QQ, KA8JBA, Martha Sargarovitz, and Barbara Myers) put in long hours to help make this the best Dayton ever for AMSAT.

AMSAT sponsored two forums. AMSAT-NA General Manager and President Doug Loughmiller (KO5I) started things off with a discussion titled: "1990: Year of the Amateur Radio Satellite." At this very well attended forum, Doug presented WD0HHU with a gold watch given to him for his efforts in Kourou, French Guiana during the MICROSAT launch campaign. Doug also talked about where AMSAT has been and what its goals are for the upcoming years.

After Doug, Tom Clark (W3IWI) discussed the Shuttle Amateur Radio Experiment (SAREX) currently planned for mid May. Bill Tynan (W3XO), AMSAT-NA's VP for Manned Operations and news correspondent Roy Neal (N6DUE) further elaborated on the SAREX mission and what it means for hams and school age youngsters all over the world.

Finally, Bob McGwier (N4HY) gave a complete run-down on the MICROSATs. Bob stated that he and Harold Price (NK6K) plan to have all the MICROSAT mailbox BBS software working by Field Day '90. Also, the next time you hear DOVE-OSCAR-17 (DO-17) on two meters, it will not only be sending packets but also voice transmissions.

During the Saturday evening banquet, N4HY was honored for his many technical contributions to amateur radio by having the "Technical Excellence Award" bestowed upon him by the Dayton Amateur Radio Association.

AMSAT-NA VP for Field Operations, Jack Crabtree (AA0P), coordinator of this year's AMSAT Dayton Hamvention volunteers, wants to thank all those who came by the booth at Dayton. Next year Jack hopes to have an even bigger AMSAT showing at the Hamvention, including an AMSAT dinner banquet.

TO ALL RADIO AMATEURS BT

Weberware 1.0 Imaging Software Now Available To Process WO-18 Pictures

Beta testing of Weberware 1.0 (WW 1.0) is complete their testing and it is now released for general distribution. This unique package made its debut at the Dayton Hamvention last week. Many a radio satellite enthusiast was thrilled as an actual picture captured from WEBERSAT-OSCAR-18 (WO-18) was processed on an IBM PC as they watched. Chris Williams (WA3PSD) of Weber State University (WSU) said that although the early pictures from WO-18 were perhaps not all that interesting, now that the ground controllers at WSU have a better understand of this MICROSAT's attitude motion, they have modified the on-board software so that more pictures of the earth are now being snapped. In addition, the software now maintains better control the CCD camera iris settings and settling time. Through more operational experience, many more exciting pictures of the earth are expected soon.

Weberware 1.0 is designed to work on IBM PC clones which support EGA or VGA graphics. WO-18 is constantly sending picture data and the imaging data can be easily collected with a PSK modem. For further information about Weberware 1.0, contact the AMSAT-NA software exchange at (301) 589-6062.

New Software Being Uploaded Into UO-14

The past several weeks have seen 9600 baud packet activity begin through UO-14's Packet Communication Experiment (PCE). This week a much more sophisticated multi-tasking operating system, known as qcF, was installed in several stages. The first stage involved the multi-tasking kernal and the Prototype Housekeeping Task (PHT). The PHT greatly facilitates the loading of software into the RAM memory of UO-14. This new software also allows ground stations to digipeat through the PCE. Many stations have been using this digipeating capacity of UO-14 to test their 9600 baud modems. Also added to the PHT software is the telemetry support for the Cosmic Particle Experiment (CPE). The CPE continuously monitors cosmic particle activity and the observations are reported in 53 bytes of data in the telemetry every five minutes.

To complete the final software load to UO-14 so that its mailbox BBS will be in operation, a great deal more work needs to be done. The software which performs the BBS functions include a file server system, the AX.25 packet handling algorithms, and more telemetry development to handle the Whole Orbit Data (WOD) tasks. A major programming milestone was reached on April 27 when a partial load of the final flight software was loaded into UO-14. Software engineers NK6K, G0/K8KA, and WB6YMH are working very diligently on both sides of the Atlantic to get the message store-and-forward software completed soon.

[ANS would like to thank G0/K8KA for providing the information for this bulletin.]

SILVER SPRING, MD MAY 5, 1990
TO ALL RADIO AMATEURS BT

Shuttle Amateur Radio Experiment (SAREX) Set To Fly On May 16, 1990

STS-35 is now scheduled to lift-off on May 16, 1990. It will be carrying not only the ASTRO-1 experiment but also SAREX-II. The following is a discussion of the goals of SAREX-II by NASA and the ARRL.

SAREX-II is a secondary payload on STS-35, currently scheduled for launch on May 16, 1990. It will be located in the Aft Flight Deck of the Space Shuttle Columbia. Ron Parise, WA4SIR, the Payload Specialist and astronomer on Columbia will be the Astronaut ham operator.

SAREX-II-02 is a secondary payload on STS-37, currently scheduled for launch on November 1, 1990. It will be located in the Aft Flight Deck of the Space Shuttle Atlantis. Ken Cameron, KB5AWP, the pilot of Atlantis will be the Astronaut ham operator.

The American Radio Relay League (ARRL) is the customer on the SAREX-II payloads. NASA gave its authorization for SAREX operations for the following reasons:

> To encourage our youth to become excited about science and technology, and
>
> To familiarize large numbers of the general public with manned space flight

NASA's intent in making astronauts available for SAREX operations is to involve the largest possible number of people, particularly youngsters, in Amateur Radio and the US space program. With amateur radio clubs and hams, our astronauts will speak over amateur frequencies directly with large groups of students, showing teachers, parents and communities how Amateur Radio energizes youngsters about science, technology, and learning.

You can easily become a part of this activity in your local school, as the astronauts will operate the SAREX equipment in the amateur two meter band. You will be able to send and receive messages via packet for periods of about 12 hours daily. The astronauts' work schedules will determine your chances for a voice or television message, but Ron and Ken may have an hour or more each day for these modes.

The Johnson Space Center's Amateur Radio Club station, W5RRR, in Houston, Texas, will re-transmit astronaut's signals to WA3NAN, at Goddard Space Flight Center, in Greenbelt, MD (near Washington, DC), and to W6VIO, at the Jet Propulsion Laboratory in Pasadena, CA. These stations, plus W1AW and several VHF and UHF repeater groups, will re-transmit the signals on most amateur bands so that you and the students can copy the communications. You will hear NASA Mission Commentary, frequent bulletins to advise listeners of astronaut planned transmissions, and all amateur two-way voice and amateur television transmissions with the shuttles. Using a simple hand-held transceiver, you can open the world of science to hundreds of youngsters. Students themselves can take part in the shuttle flight via a packet connection, and some will even be able to talk directly to the astronauts in orbit.

ARRL and AMSAT are co-sponsoring these exciting missions, with AMSAT heading up technical operations. Hundreds of Amateur Radio operators have already been working behind the scenes for months. The ARRL takes the lead with information and educational support. ARRL Educational Activities Branch (EAB) and NASA HQ will create lesson plans for teachers. All you need to provide is a 2-meter rig or a packet radio setup. If you are a teacher or instructor, contact ARRL EAB to get everything you will need and regular news updates. If you are a parent or a grandparent, contact ARRL EAB and a local school. EAB will send you materials, including ways to convince teachers and school administrators that Amateur Radio is an important discipline the school should take advantage of on a full-time basis.

This a tremendous opportunity for you to showcase SAREX 1990 and amateur radio to kids of all ages in a big way. Plan on being a part of it; contact ARRL EAB now and give your best to our exciting hobby and to our hope for tomorrow: America's youth.

Listen to the ARRL Bulletins on W1AW (see QST for CW and voice bulletins) on a daily basis; and to the AMSAT Nets on Tuesdays (U. S.), 3.840 MHz, 01:30Z to 03:00Z, and on Sundays (international), 14.282 MHz, 18:00Z to 21:00Z, +/- QRM.

[ANS would like to thank ARRL and NASA for this contribution. Stay tuned next week to the ANS bulletins for more details about the STS-35 mission and its amateur radio operations.]

PHASE III-D DESIGN MEETING

HR AMSAT NEWS SERVICE BULLETIN 125.06 FROM AMSAT HQ
SILVER SPRING, MD MAY 5, 1990
TO ALL RADIO AMATEURS BT

Preliminary Design Review for New Satellite Held in Germany

Amateurs from around the world who are involved in the Radio Amateur Satellite Service are meeting in Marburg, West Germany from May 7 through May 9 to begin work on another major amateur satellite project. The purpose of the meeting is to set specific design goals for Phase III-D. The three days of meetings will cover a wide range of topics. Areas to be discussed will include: launch opportunities, orbit choices and constraints, transponder choices, antenna design, on-board computer systems, and propulsion systems. In addition to setting hardware and software design goals, equally important discussions will focus on labor division between groups, monetary commitment required, and development of a communication structure between groups involved in the program.

AMSAT-NA will be represented at the meeting by Jan King, W3GEY, VP-Engineering, Bob McGwier, N4HY, Dick Jannson, WD4FAB, and Dick Daniels, W4PUJ. (It appears that these guys just can't seem to grasp the concept of "taking a break").

Once formal design goals have been determined, they will made available through the AMSAT News Service.

NEW AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 125.08 FROM AMSAT HQ
SILVER SPRING, MD MAY 5, 1990
TO ALL RADIO AMATEURS BT

New Transponder Schedule in Effect After Magnetorquing

Command Stations have been magnetorquing AO-13 during the perigees of orbits this past week. This procedure is essentialy complete and has re-aligned AO-13 for better pointing (squint) angles. A new transponder schedule has been announced by the AO-13 Command Station Team:

AO-13 Transponder Schedule from 05 May 90

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis   : MA 220 to MA 040

The best estimate of the current attitude is:

BLON = 180 and BLAT = +3   for 05 May 90

More exact values will be announced soon. Only the Mode-S transponder and the Mode-B beacon will be ON from MA 135 to MA 140.

AO-10 is currently experiencing poor solar panel illumination angles and until further notice its transponder is not available for use.

Subj: SAREX News Bulletins

SB SAREX @ AMSAT < W3IWI $SAREX.001
SAREX Bulletin #1: Concerning logs

SAREX INFORMATION BULLETIN SAREX.001
de W3IWI 5/6/90

The WA4SIR flight aboard the STS-35 flight of the Shuttle Columbia is still officially scheduled for early May 16th (GMT), although there are some hints that it might slip by one day. The SAREX mission will carry the packet ROBOT automatic QSO machine which will allow many amateurs around the world to have two-way packet QSO's with the Shuttle during the times when our ham astronaut, Ron Parise is busy.

To work the ROBOT, you transmit on 144.950 MHz and listen to the Shuttle on 145.550 MHz. Subsequent SAREX information bulletins will give you operating hints and describe the schedule in more detail.

If you are successful in making a two-way QSO, you call and your unique QSO serial number will be automatically logged and you will receive a QSL card after the mission. You will know you met all requirements of a two-way QSO by seeing your call in the QSL beacon which will be sent every 2 minutes and looks something like:

```
    WA4SIR>QSL <UI>:
    NI3F/186 WB2TNL/185 W3IUI/179 WB3AFL/177 NF3N/176 WA3EPT/175
    N4QQ/174 W3IWI/172 JY1/153 U6MIR/127
```

If you are heard by the ROBOT, your call will appear in the QRZ beacon which will look something like:

```
    WA4SIR>QRZ <UI>:
    #3405-NE3H NI3F K1LNJ WB2TNL WB3ILO N3ACL N3FWX WA3TSD WA3USG
    etcetera
```

where the #3405 is a serial number incremented every 2 minutes when the QRZ beacon is sent.

Unlike the QSL "worked" list, the QRZ "heard" list is not retained in the ROBOT and the laptop computer on the shuttle. In order to send SWL cards to those who were heard, it will be necessary to have amateurs around the world help to collect the list. When you are monitoring the WA4SIR SAREX transmissions, try to capture the beacons and send them in to us in machine readable format. We are only interested in the QRZ and QSL beacon information; please strip out everything else (like QSOs monitored, any other beacons, etc.). You may send it through the amateur packet network addressed like this:

SP SAREX @ W3IWI.MD.USA

or via the Internet addressed like:

sarex@tomcat.gsfc.nasa.gov

and make the Subject: field contain the date/time of the beacons like:

May 19 @ 03:42z

/EX
SB SAREX @ AMSAT < W3IWI $SAREX.002A
SAREX Bulletin #2: Hints and Suggestions

SAREX INFORMATION BULLETIN SAREX.002
de W3IWI 5/6/90

Here are several hints that may help you make a successful packet QSO with the SAREX ROBOT that will fly with Ron Parise, WA4SIR in mid-May.

1. Frequencies: Your transmitter uplink frequency should be 144.950 MHz and you should listen for the shuttle downlink 600 kHz higher on 145.550 MHz. Under no conditions should you transmit on the 145.550 downlink!

Since there may be other packet or voice activity in your area on these frequencies, local coordination to insure a clear frequency during the ten day STS-35 mission may be needed.

2. Modulation: The uplinks and downlinks are ordinary AFSK/FM 1200 BPS signals, just like most terrestrial VHF packets. No special modems are needed. You are advised to check your transmitter's FM deviation and set it to 3 kHz or less. Most radios are typically set to 5-6 kHz and this will be too wide because of doppler shifts. If you don't have a deviation meter, listen on another radio and crank the tone level down until you hear the volume drop noticeably. Most people run too much deviation on their packet signals anyway, and you will probably find this improves the reliability on terrestrial paths too!

3. When to hear/work the shuttle: During the mission Keplerian elements and predictions will be sent frequently by WA3NAN, W5RRR, W6VIO, and many local FM repeaters, as well as by packet bulletins addressed to @AMSAT. Check with your local AMSAT area coordinators for information in your area. In general in the USA, the windows are in the late evening and early morning hours. Don't expect the SAREX hardware to be activated until the second day of the ten-day mission. Because the inclination of the shuttle orbit is only 28.5 degrees, the signals can only be heard

between about +43 and -43 degrees latitude.

[continued in part 2]

/EX
SB SAREX @ AMSAT < W3IWI $SAREX.002B
SAREX Bulletin #2: Hints cont'd

SAREX INFORMATION BULLETIN SAREX.002 continued
de W3IWI 5/6/90

4. LISTEN!!!: Most packeteers don't listen to the BRAAAAP! from their radios, but you should listen during the shuttle activity. If Ron is personally available, he may turn off the SAREX packet hardware and be QRV on voice.

5. Connecting to the shuttle: All you do is to issue a connect. If you are heard, you will see something like this:

```
   cmd: CONNECT WA4SIR
   *** Connected to WA4SIR
   #191--- Tnx QSO with the SAREX Shuttle "ROBOT" automatic QSO machine
   *** DISCONNECTED
```

When the ROBOT hears your "ack" of its transmission, it will disconnect and you will be in the log. Because the ROBOT queues information for 3 seconds and sends several replies in one transmission, you should set your DWAIT to about 4 seconds.

6. Multiple QSO's: Once you have worked the ROBOT and make it into the log, no further QSO's from you will be logged (even if you use a different SSID). Give others a chance and don't connect multiple times!

7. Monitor!!!: Every 2 minutes a beacon addressed to QRZ will list stations heard recently, and the QSL beacon will list those worked. Every 3 minutes the Metabeacon (up to 1.7 kbytes in 7 packet frames) addressed to QST will send text describing shuttle activities. Monitor these beacons to keep informed. In Bulletin #1 we ask for you to submit copies of the QRZ and QSL beacons you copy.

8: Your chances for success: Signals from many hundreds of stations can be heard from the shuttle. With FM transmissions, only the strongest signal "wins", just like in a DX pileup. To help, the ROBOT can have up to 9 QSO's in progress at any one time. Perserverance and a well equipped station will help -- but if activity levels are high and the uplink channels are busy, it will be a matter of luck.

/EX

SB SAREX @ AMSAT < W3IWI $SAREX.003
SAREX Bulletin #3: ASTRO-1

SAREX INFORMATION BULLETIN SAREX.003

de W3IWI 5/6/90

Despite all the SAREX activity, our STS-35 ham astronaut Dr. Ron Parise, WA4SIR, is NOT officially going into orbit for the ultimate DXpedition! The reason for the STS-35 mission is to fly ASTRO-1.

With the recent successful STS-31 mission deploying the Hubble Space Telescope (HST) was the first step of an astronomical "double-header". It will be followed in mid-May by the ASTRO-1 mission which will carry a number of specialized telescopes on its 10 day mission. Ron is one of the STS-35's crew of seven which also includes

Vance Brand, Mission Commander
Col. Guy Gardner, Pilot
Dr. Bob Parker and Mike Lounge, Mission Specialists
Drs. Jeff Hoffman, Sam Durrance and Ron Parise, Payload Specialists

The ASTRO-1 Observatory in the STS-35 payload bay consists of four instruments. The first three are mounted on a single pointing systems and fly above the earth's atmosphere to observe in the ultraviolet spectral regions:

1. HUT: The Hopkins Ultraviolet Telescope from Johns Hopkins Univ. is a spectroscopic instrument for observing faint objects like quasars, active galactic nuclei and normal galaxies in the far UV.

2. UIT: The NASA/Goddard Ultraviolet Imaging Telescopy is designed to obtain images (pictures) of hot stars and galaxies with a wide field of view.

3. WUPPE: The Wisconsin Ultraviolet Photo-Polarimeter Experiment is intended to observe the polarization of UV light from quasars, hot stars and galaxies.

This cluster of three UV instruments work together and should make 200-300 observations during the mission.

The fourth instrument is an X-ray experiment with its own independent pointing system:

4. BBXRT: The Broad-Band X-Ray Telescope views high-energy objects like active galaxies and quasars. While BBXRT can be operated independently of the 3 UV instruments, it can be slaved to the UV telescopes for coordinated observations. It is also expected to make 200-300 observations during the mission.

The ASTRO-1 mission is but the first of a series. These and similar instruments will be reflown on later missions. ASTRO requires an orbit with maximum time at night, and minimum exposure to charged particles in the South Atlantic Anomaly -- these requirements dictate a nighttime launch from Cape Kennedy.

Subj: SAREX.004: Launch Delay

SB SAREX @ AMSAT < W3IWI $SAREX.004
WA4SIR SAREX/STS-35 LAUNCH DELAYED

SAREX Bulletin SAREX.004
de W3IWI 5/9/90

The flight of WA4SIR with the SAREX hardware aboard the Shuttle Columbia is delayed at least 2 weeks, meaning the flight will be in June at the earliest. The problem is contamination in a valve in one of the two redundant freon cooling systems. All the tubing associated with the valve is sweated together and there is a lot of concern about using torches in the orbiter to fix it on the launch pad. Normally a repair like this would be done in Orbiter Processor Facility, but this would mean a rollback of the Columbia and a long delay which would in turn force a re-scheduling of the mission. Since the valve replacement is not a usual activity, it is not possible to predict the delay. Stay tuned for more information.

The following is excerpted from a 5/9 NASA press release:

NASA managers today decided to replace an apparently faulty valve in the orbiter Columbia's freon coolant loop. The work, will likely delay the launch of STS-35 by 2 to 3 weeks. A better estimate of the time required to perform the work will be available early next week. Shuttle managers assessed the relative risks associated with performing the work at the launch pad, versus in the Orbiter Processing Facility, and decided that completing the replacement and checkout on the pad is as safe and effective.

"We are obviously disappointed that we are not ready to fly," said Space Flight Associate Administrator Dr. William B. Lenoir. "However, this particular system is absolutely critical to the safety of the crew and overall mission success, so we have decided to change the component."

SILVER SPRING, MD MAY 12, 1990
TO ALL RADIO AMATEURS BT

Payload Cooling Problem Delays STS-35/SAREX-II Mission

NASA managers this week announced that they have decided to delay the launch of STS-35 due to a problem in a freon cooling system designed to keep the temperature of electronic instruments in the ASTRO-1 Observatory payload within safe limits. The repair of the faulty cooling valve in Shuttle Columbia could take up to three weeks depending on if the work can be done at the launch pad. It is hoped that Columbia will not have to be rolled back to the Orbiter Processing Facility for this work. On this STS-35 mission, payload specialist Ron Parise (WA4SIR) will be be the station operator of WA4SIR-1 for the Shuttle Amateur Radio Experiment (SAREX) that will consist of a ROBOT packet station and voice operation on 2 meter FM.

Based on information from NASA press releases, it appears that the STS-35/SAREX mission will not be launched before the first week of June. And that depends on how well this never-done-before repair goes. As soon as ARRL/AMSAT officials have be notified about the new launch date, all pertinent information will be issued immediately via ARRL bulletins, ANS bulletins, and AMSAT Nets.

Microsoft Software Found to Cause Intermittant Problems

Some InstantTrack users have recently discovered a problem where the map "goes away" or "freezes" when they use their mouse. InstantTrack's author Franklin Antonio (N6NKF) has determined that this problem is a result of a conflict with the Microsoft mouse driver [MOUSE.COM] versions 7.00, 7.01, 7.02, and 7.03. Changing to a mouse driver version earlier than 7.00 or later than 7.03 is the cure. An update of InstantTrack is not required to resolve this problem.

Microsoft is aware of the problem, as it occurs with many programs other than InstantTrack. InstantTrack users who are experiencing this problem should contact Microsoft and ask to obtain version 7.04 of MOUSE.COM.

TELEMETRY ARCHIVE FORMAT ANNOUNCED

HR AMSAT NEWS SERVICE BULLETIN 132.04 FROM AMSAT HQ
SILVER SPRING, MD MAY 12, 1990
TO ALL RADIO AMATEURS BT

OSCAR Telemetry Archive Data Submission Format Announced

Reid Bristor (WA4UPD), AMSAT-NA Microsat Data Archive Manager has released the following information intended to govern submissions to the telemetry archive. Submissions using any file naming convention will be accepted through June 1, 1990 as previously announced. Following that date, files submitted not conforming to the following requirements may be returned for updating by the submitter.

Data is currently being stored within the archive in raw format since this form contains all information and uses the smallest amount of file space. Abbreviated submissions may consist only of raw digital telemetry or CW.

Whole Orbit Data collected from the Microsats to date has been archived; it was collected in single sessions and downlinked repeatedly afterwards. Future WOD reports and all live data, past, present, and future are requested from all satellite listeners.

Reid reports that submissions of and requests for Microsat data are picking up.

DATA SUBMISSION REQUIREMENTS

MEDIA FORMAT:** IBM 5 1/4", 180k,360k,1.2m
IBM 3 1/2", 770k,1.44m
COMMODORE 1541, 1571, 1581
DEC RX01/02, RX50, TK50

FILE FORMAT: 1 file per pass
Filename - mmddhhmm.ssx
mm = Month (02=Feb, 05=MAY, 11=NOV, etc.)
dd = DAY (Correct UTC DAY)
hh = HOUR OF AOS (UTC)
mm = MINUTE OF AOS
ss = SATELLITE NUMBER (17 = DOVE, 19 = LUSAT, etc.)
x = DATA TYPE AS INDICATED

DATA TYPE (x) - A = ASCII (DOVE ascii text, N4HY dump)
C = CW (LUSAT, FO20, AO13, etc.)
P = Processed (N4HY, or LU7ABF, etc.)
R = RAW (KISS format)
T = TELEMETRY
* W = WEBERSAT info

"*" indicates additional characters will be assigned as WEBERSAT PICTURE data matures.

"**" For accomodation of other disk formats, contact WA4UPD.

SUBMIT TO: Reid Bristor, WA4UPD

NEW AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 132.06 FROM AMSAT HQ
SILVER SPRING, MD MAY 12, 1990
TO ALL RADIO AMATEURS BT

New Transponder Schedule in Effect After Magnetorquing

Command Stations have completed magnetorquing of AO-13 during the perigees of recent orbits. This procedure is essentialy complete and has re-aligned AO-13 for better Sun angles. The new transponder schedule has been announced by the AO-13 Command Station Team:

AO-13 Transponder Schedule from 05 May 90

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130 (Mode S Beacon only)
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

The best estimate of the current attitude is:

BLON = 180 and BLAT = +3   for 05 May 90

More exact values will be announced soon. Only the Mode-L transponder and the Mode-S beacon will be on from MA 125 to MA 130. Cross mode B and S QSOs are possible during MA 135 to 140.

AO-10 is currently experiencing poor solar panel illumination angles and until further notice its transponder is not available for use.

FO-20 ELEMENT SET PROBLEMS NOTED

HR AMSAT NEWS SERVICE BULLETIN 132.07 FROM AMSAT HQ
SILVER SPRING, MD MAY 12, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NAs Orbital Data Manager, Dick Campbell, N3FKV has been informed by Tak Okamoto of JAMSAT that the NASA elements for FO-20 are in error. It appears that NORAD is tracking another vehicle launched with MOS-1B and FO-20 (called DEBUT). This vehicle is about 2.75 minutes behind FO-20 and the elements from NASA appear to be for this spacecraft. The current elements being distributed for FO-20 are valid if approximately 2.5-3.0 minutes are added to the user's clock, which should be acceptable in most cases. Dick is working to resolve this element set problem.

Dissemination of this information to FO-20 users will be appreciated.

SB SAREX @ AMSAT < W3IWI $SAREX.005
SAREX/WA4SIR flight May 30th

SAREX Bulletin SAREX.005
de W3IWI May 19, 1990

AMSAT has received word that launch of the Shuttle Columbia STS-35 mission with Ron Parise, WA4SIR and the SAREX amateur radio hardware may now take place as early as Wed. May 30 at 04:38z. A flight readiness review that will confirm the launch date is planned for Thurs. May 24.

The NASA launch status report issued 14:30z on Friday, May 18th from

Cape Kennedy reports:

STS-35 - COLUMBIA (OV 102) - PAD 39-A

"A new flow proportional valve was successfully installed in Columbia's freon cooling system. A leak check of the freon cooling system pump is planned today. Later today, vacuuming of the system will begin and will continue through the weekend. Early next week, the system will be filled with refrigerant and tested. Repair work and associated testing of the freon cooling system is estimated to be complete by next week."

"Payload officials are continuing to monitor the status of the Astro payload. The Broad Band X-ray Telescope, one of the Astro-1 telescopes, was serviced with argon yesterday."

"Pre-launch activities scheduled this weekend include the installation of ordnance devices, pressurization of the orbiter's hypergolic propellant tanks and loading the dewars, or storage tanks, on the pad's structure with liquid oxygen and liquid hydrogen reactants. During the launch countdown, the orbiter's fuel cell storage tanks will be loaded from these dewars."

Based on an 04:38z launch, the following preliminary Keplerian elements have been supplied by W5RRR at the NASA Johnson Space Center. First the "2-liner" element set JSC-0011:

```
STS-35
1 00035U          90150.24513889  .00031000           22174-3 0   110
2 00035  28.4690 148.3930 0005720 246.6067 119.6564 15.71792660    20
```

And the same data in the longer "AMSAT standard" format:

```
Satellite: STS-35
Epoch time:      90150.24513889
Element set:     JSC-0011
Inclination:       28.4690 deg
RA of node:       148.3930 deg
Eccentricity:    0.0005720
Arg of perigee:   246.6067 deg
Mean anomaly:     119.6564 deg
Mean motion:   15.71792660 rev/day
Decay rate:       3.1e-04  rev/day^2
Epoch rev:            2
```

ZRO TEST SCHEDULE ANNOUNCED

HR AMSAT NEWS SERVICE BULLETIN 139.01 FROM AMSAT HQ
SILVER SPRING, MD MAY 19, 1990
TO ALL RADIO AMATEURS BT

Station Receiving Tests Schedule Announced

The ZRO Memorial Technical Achievement Award Program, or "ZRO Test" will be reactivated in late May following the mid-May reorientation of AMSAT-OSCAR-13. This activity is a test of operating skill and equipment performance.

During a typical ZRO run, a control station will send numeric code groups using CW at 10 words-per-minute. At the beginning of the run, uplink power from the control station is set so that the downlink matches the general beacon downlink strength. This is level "zero". The control operator will send and repeat a random five-digit number, then lower uplink power by 3 dB (half power) and repeat the procedure with a new random number. This pattern is repeated until a level 27 dB below the beacon is reached (level "nine").

A participating listener monitors the downlink signals until they can no longer copy the numbers. Those who can hear the beacon will qualify for the basic award by copying the code group heard at level "zero". The challenge is to improve receiving station performance to a point where the lower level downlink signals can be copied (levels 6 through 9).

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" tests on 435.945 MHz.

Saturday May 26, 1990 at 2230 UTC "JL"
Sunday May 27, 1990 at 0010 UTC "B"
Sunday June 03, 1990 at 0210 UTC "JL"
Sunday June 03, 1990 at 0350 UTC "B"
Saturday June 16, 1990 at 2200 UTC "JL"
Saturday June 16, 1990 at 2340 UTC "B"
Saturday June 30, 1990 at 1840 UTC "JL"
Saturday June 30, 1990 at 1930 UTC "B"

Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures and means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

PHASE 3A REMEMBERED, PART I

HR AMSAT NEWS SERVICE BULLETIN 139.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 19, 1990
TO ALL RADIO AMATEURS BT

PHASE 3A Lost Ten Years Ago May 23, 1980, Part I

Next Wednesday marks the tenth anniversary of the death of an OSCAR -- an OSCAR which had all the potential of being a great satellite. On May 23, 1980 Phase 3A sat atop the Ariane launch vehicle known as LO-2, attach sideways to the huge Max Planck Institute's Firewheel experiment (See ORBIT June/July '80, pg 9). On that day optimism was running high at the European Space Agency's Kourou, Fr. Guianna launch center because of a previous launch success, and there was no reason to think that LO-2 wouldn't be equally successful. For those who are straining to remember, AMSAT President Tom Clark (W3IWI) was giving the "play-by-play-action" from the Goddard Space Flight Center (GSFC) radio club station, WA3NAN, to radio amateurs around the world through the AMSAT Launch Information Net/Service (ALINS). The launch window opened at 11:30 UTC; because of intermittent rain showers and minor equipment malfunctions "holds" were common during the first hours of the launch window. Finally, the LO-2 vehicle lifted off at 14:29:40 UTC. At this point thousands of hams were holding their breaths as FY7KRU and WA3NAN provided the commentary on the last few moments Phase 3A's short life: at 14:32:57 UTC French controllers were heard saying things like: "non-nominal flying...problem in one engine...the rocket is going down...Kourou radar still tracking" and finally, the worst shock of all, the word "splashdown" was uttered. Phase 3A never reached orbit and the greatness it was destined for. Jan King, holding back tears, summed it up shortly after the launch failure when he said that "the [radio amateur] community will never know what they lost today."

PHASE 3A, REMEMBERED PART II

HR AMSAT NEWS SERVICE BULLETIN 139.03 FROM AMSAT HQ
SILVER SPRING, MD MAY 19, 1990
TO ALL RADIO AMATEURS BT

Phase 3A Lost Ten Years Ago May 23, 1980, Part II

Jan, Tom, and many of the volunteers who had helped build Phase 3A listened with great sadness as they realized that the focus of many thousands of hours of effort (Jan estimated 30 man years!) was now sitting at the bottom of the Atlantic. Jan recently related the events of that day to WD0HHU saying that upon realizing what had happened he flung a very large book across the room and shouted something appropriate at the top of his lungs. Now, however, he says he doesn't recall what he said -- it is all a "blurr." It should be noted that Jan and the other volunteers were not very far from the tiny little building on the GSFC grounds where Phase 3A was built, integrated, and tested.

According to Tom Clark, "the gloom, despair, and depression lasted for about a day" when Jan and Karl Miezer (DJ4ZC) were heard saying: "Darn it! We worked to hard to quit now. Lets try again. Lighting can't strike twice." At that point Tom wrote to all the AMSAT members requesting their moral and financal support in order to start Phase 3B. The reponse was immediate: over $30,000 was raised in a few months to start the construction of Phase 3B. This unequivocal show of support proved that radio amateurs from around the world wanted to see the AMSAT OSCAR satellite program continue. Recovering quickly from this disaster, AMSAT volunteers realized they still had the knowledge and know-how to build another OSCAR satellite and another: Phase 3B became AO-10, and later, Phase 3C became AO-13.

This week, May 23, 1990, one decade later, take a moment to think about Phase 3A, at 14:36:38 UTC when mission controllers in Kourou announced a "splashdown."

UO-14 9600 BAUD UPDATE

HR AMSAT NEWS SERVICE BULLETIN 139.04 FROM AMSAT HQ
SILVER SPRING, MD MAY 19, 1990
TO ALL RADIO AMATEURS BT

TNC operations at 9600 bps

Jeff Ward G0/K8KA and other members of the University of Surrey Engineering Team have recently been experimenting with 9600-baud operation using KISS software on TNC-2 clones. The clones used are a Pac-Com TINY-2 and an MFJ 1270. Initially, a version of KISS dated "26 Mar 87" was used but it was found that this version did not work very well for near-full-duplex 9600-baud KISS operation.

Jeff et. al. upgraded the firmware in the TNCs to a version of KISS dated "20 Mar 88". They found that operating on either the Pac-Com or the MFJ TNC with the updated KISS firmware will correctly receive a continuous stream of 9600 baud packets and relay them to the host computer at 9600 baud. The TNC did not seem to drop packets, even when operating at the 2 MHz standard clock speed. It is believed that this is the version of KISS which shipped with the current TAPR firmware version 1.1.7.

Jeff reports that, unfortunately, with a 9600 baud synchronous input stream and a 9600 baud asynchronous output stream, the TNC's buffers begin to fill up. When the buffer fills (after a minute or so), the TNC crashes. An extra long packet is passed to the host, and operation (on the async side) ceases. You can cure this by turning the async link up to 19.2 kbps - if your host hardware and software can keep up.

Recently, the UoS Engineering Team received a version of KISS firmware dated "11 Dec 89". This version seems not to crash when presented with a continuous 9600 baud input stream and 9600 baud async speed. A setup running this code ran successfully for a number of hours. Unfortunately, this version of the firmware cannot keep up with the input stream unless the TNC clock rate is increased to 4 MHz. If a 2 MHz clock is used, approximately 50% of the packets on a BTTW 9600 baud downlink will be missed.

Jeff concludes: "Get KISS dated "11 Dec 89" or later, jump your TNC-2 clock rate up (using JMP2), and wait for further entertainment as we try full-duplex, full-duty cycle 9600 baud connected mode in a month or so."

[AMSAT thanks Jeff Ward G0/K8KA for the information for this bulletin]

AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 139.06 FROM AMSAT HQ
SILVER SPRING, MD MAY 19, 1990
TO ALL RADIO AMATEURS BT

Transponder Schedule for AO-13 Effective 05MAY90

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130 (Mode S Beacon only)

Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

The best estimate of the current attitude is:

BLON = 180 and BLAT = +3 for 05 May 90

More exact values will be announced soon. Only the Mode-L transponder and the Mode-S beacon will be on from MA 125 to MA 130. Cross mode B and S QSOs are possible during MA 135 to 140.

AO-10's Mode-B Transponder Now Available for Use:

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

[AO-10 update received from Graham Ratcliff, VK5AGR, via AO-13 beacons.]

SB SAREX @ AMSAT < W3IWI $SAREX.006
SAREX Btn #6: WA4SIR-? Call Clarification

SAREX BULLETIN SAREX.006
de W3IWI May 23,1990

Concerning the WA4SIR-? call for SAREX ROBOT operations: In the articles in the AMSAT JOURNAL and 73 MAGAZINE, it was indicated that the SAREX ROBOT would use the call WA4SIR-1 (i.e. using a SSID = 1), and in more recent SAREX @ AMSAT packet bulletins it was indicated that the call would just be just WA4SIR (i.e. SSID = 0); several people sent messages indicating that they were confused.

Both the HK21 ROBOT TNC and the operational software for the GRID laptop computer have the calls defaulted to WA4SIR (SSID = 0) and that call should be used unless, for some unanticipated reason, the defaults are over-ridden.

The best advice is for you to MONITOR the downlink signals from STS-35 and use whatever call you see on the downlink. The ROBOT TNC code uses only one

SSID at a time.

/EX
SB SAREX @ AMSAT < W3IWI $SAREX.007
SAREX Btn #7: Some comments on timers

SAREX BULLETIN SAREX.007
de W3IWI May 23,1990

This note is to give you some additional information on timers involved in sequencing ROBOT packet transmissions.

Because the WA4SIR SAREX ROBOT will be bombarded with signals from tens or hundreds of ground-based users when STS-35 is flying over populated areas, it is not possible for the ROBOT TNC and radio to use normal half-duplex packet procedures -- the CD (carrier detect) signal will simply never drop!

The ROBOT will be running in a modified full-duplex mode. When the ROBOT copies a valid packet frame (or when it is time to send a beacon), the data to be sent is put into a buffer and a timer (which we call the FUDtimer) is started. The ROBOT firmware then queues all other outgoing transmissions in the buffer until FUDtimer expires (3 seconds later), and all downlink frames in the queue are sent in one long transmission. Many who had QSOs with the SAREX demo station at the AMSAT or HEATH booths at Dayton commented on how sluggish the 3 second FUDtimer seemed to be when compared to normal packet operations.

Since the SAREX handheld radio cannot receive when it is transmitting, users should insure that they remain silent and listen when the shuttle is transmitting. In other words, DO NOT RUN FULL DUPLEX ON THE GROUND! Leave your TNC in half-duplex mode (FULLDUP OFF) with CD active just like you do for normal VHF packet operations.

However you should be careful with the setting of two of your TNC's timers -- DWAIT and FRACK. DWAIT is the time interval after your Carrier Detect light goes out and before your transmitter turns on. You want to make sure your connects requests and acks are contained in the 3 second FUDtimer window. If everybody runs the same DWAIT (like the typical 0.1 - 0.5 second values used for terrestrial packet), then everybody will be transmitting at the time. Part of the key to your success when uplink QRM is heavy is to pick a DWAIT that nobody else is using!

FRACK sets the time interval between your transmissions. After you send a frame, your TNC waits for the FRACK time, and then waits for the Carrier Detect signal to drop, then waits DWAIT, and then tries again. You should make sure your FRACK is at least 3 seconds so that you are not transmitting when the ROBOT's FUDtimer decides it is time for it to transmit -- if you are transmitting at the same time, you will miss any packets the shuttle is addressing to you and you won't have a successful QSO.

Note that your DWAIT (how soon do I transmit?) and FRACK (then how long do I wait?) parameters and the need to stop transmitting so you can hear a reply are just like you encounter when working a DXpedition pileup on HF. If the DX station has a pattern of listening for a few seconds (=FUDtimer) before transmitting, you may have better luck being the LAST station he hears, after the din dies down. The differences are that (1) the ROBOT is a computer and is very predictable and (2) the ROBOT can be working several stations at one time.

WA4SIR's SAREX mission on STS-35 is the ultimate DXpedition!

SAREX Btn 8: NASA Announces Launch Date

SAREX Bulletin AREX.008
de W3IWI May 24,1990

Late this afternoon NASA released the following announcement concerning next week's launch of the Shuttle Columbia with WA4SIR and the SAREX hardware:

"STS-35 FLIGHT READINESS REVIEW STATEMENT 5/24/90 5:10P.M. EDT"

NASA managers today set May 30 as the launch date for Shuttle Mission STS-35 which will carry the Astro-1 payload into orbit. Columbia will be launched during a window that opens at 12:38 a.m. EDT and extends for 2 1/2 hours. The mission is scheduled to last 10 days. Landing is set for 4:24 p.m. PDT on June 8."

The May 30 at 12:38 AM EDT = 04:38z launch window is the same as was indicated in our SAREX.005 bulletin released May 20th. That bulletin contains the predicted Keplerian element set JSC-0011 which will apply for a nominal launch at the time the window opens.

We plan to circulate a bulletin this weekend (probably SAREX.009) which will contain a more detailed time-line for the SAREX activities.

SAREX Bulletin SAREX.009
de W3IWI May 27, 1990

This table details planned events for Ron Parise, WA4SIR's SAREX activities on the STS-35 mission of the Shuttle Columbia. The tabular entries are given in both Mission Elapsed Time (MET) and UTC (GMT) time. If the launch is delayed from May 30th at 04:38z, the all UTC times should be adjusted accordingly. All times are approximate and should only be used for guidance.

In general Ron's voice opportunities for scheduled demonstrations all take place during the pre-sleep and post-sleep periods. The planned classroom demonstrations to be relayed via Australia and Brazil are denoted by the (VK) and (PY) windows. Any time Ron might choose to try general voice operation should also be during the pre- and post-sleep windows. Ron must also eat and take care of personal matters during these pre- and post-sleep periods.

SAREX ROBOT packet operations are planned for the approximately 12 hour windows between the post- and pre-sleep while Ron is on duty with the ASTRO experiments.

TO ALL RADIO AMATEURS BT

STS-35/SAREX-2 Planned Lift-off Set For May 30, 1990 04:38:00 UTC

This week, NASA officals informed AMSAT and the ARRL that the planned lift-off of the Shuttle Columbia carrying the Shuttle Amateur Radio Experiment (SAREX) is now planned for Wednesday, May 30, 1990 at 04:38:00 UTC. PLEASE NOTE: this is Wednesday morning, 12:38 A.M. EDT in the U.S. Payload Specialist Ron Parise (WA4SIR) will be the control station operator during the ten day mission. The SAREX payload will consist of a ROBOT packet radio station which will use the call WA4SIR. Also, Ron will be operating 2 meter FM voice when his work schedule permits. Stations wishing to connect to WA4SIR will receive a QSO number which they can use to verify their contact when they send in their QSL card. QSL'ing will be handled by the ARRL. Cards may be sent to the American Radio Relay League, 225 Main Street, Newington, CT, 06111. Please include a s.a.s.e. with your QSL card.

STS-35 PRELIMINARY ELEMENTS

HR AMSAT NEWS SERVICE BULLETIN 146.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 26, 1990
TO ALL RADIO AMATEURS BT

STS-35/SAREX-2 Preliminary Orbital Elements & Packet/Voice Frequencies

On Wednesday, May 30, 1990, 04:38:00 UTC the Shuttle Columbia is scheduled to lift-off from Cape Canaveral carrying the Shuttle Amateur Radio Experiment (SAREX). As part of the crew, Ron Parise (WA4SIR) will be aboard with the capability to work 2M FM voice and packet radio. The primary frequencies which will be used for both operations will be a simple 600 kHz repeater split of 145.550/144.950 MHz.

The following is the best set of orbital elements available at press time from NASA for the STS-35 mission.

```
STS-35
1 00035U          90150.24513889  .00031000           22174-3 0   110
2 00035  28.4690 148.3930 0005720 246.6067 119.6564 15.71792660    20
```

And the same data in the longer "AMSAT standard" format:

```
Satellite: STS-35
Epoch time:      90150.24513889
Element set:     JSC-0011
Inclination:       28.4690 deg
RA of node:       148.3930 deg
Eccentricity:    0.0005720
Arg of perigee:   246.6067 deg
Mean anomaly:     119.6564 deg
Mean motion:   15.71792660 rev/day
Decay rate:       3.1e-04  rev/day^2
Epoch rev:            2
```

For updates on the orbital elements for STS-35 throughout the ten day mission, stay tuned to WA3NAN, W5RRR, W6VIO, AMSAT Nets, and ARRL bulletins.

SB ALL @ AMSAT $ANS-146.03
SAREX FREQUENCY LISTING

HR AMSAT NEWS SERVICE BULLETIN 146.03 FROM AMSAT HQ
SILVER SPRING, MD MAY 26, 1990
TO ALL RADIO AMATEURS BT

Downlink/Uplink Frequencies to be used on Upcoming Mission

Get out your HTs and HT programming manuals. You will want to program your 2 meter FM transceivers with the following information.

	Shuttle TX Freq	Shuttle RX Freq	
North/South American Frequencies	145.55 MHz	144.95 MHz	*** Primary ***
	"	144.91 MHz	
	"	144.97 MHz	
Remainder of the World Frequencies	145.55 MHz	144.95 MHz	*** Primary ***
	"	144.70 MHz	
	"	144.75 MHz	
	"	144.80 MHz	
	"	144.85 MHz	

These are the frequencies Ron Parise (WA4SIR) will use on both voice and packet. Please note that the frequencies where Ron will be listening for stations ARE DIFFERENT than the one he will transmit on. This is a very important fact to understand. Ron will transmit to earth (downlink) on a single frequency: 145.55 MHz. He will listen for stations transmitting to him (uplink) on the other frequencies listed. This "split" operation is used quite successfully by DXers when operating in an environment where large pile ups are expected.

The first pair of frequencies (noted as primary) is a standard 600 KHz split used by repeaters. This pair was selected so that communicating with SAREX could be accomplished by Hams using standard FM transceivers. If Ron finds that the receive QRM becomes unmanageable, he may listen on the alternate frequencies listed. In North America, the lower section of the FM repeater bandplan extends as high as 144.90. This is why the uplink frequencies only extend down to 144.91 MHz.

There will be no simplex operation with SAREX on either voice or packet. Although packeteers are not used to operation with a TX/RX offset, in this case, it is the only way to connect to SAREX. If you transmit on 145.55 MHz the only people who will hear you are those other Hams in your area trying to contact SAREX (You will most likely become an notorious instantly!).

There should be about 3 KHz of Doppler shift due to the orbital velocity of the Columbia spacecraft. By limiting the deviation of your transmitter to 3 KHz, Ron's receiver should have little trouble capturing your signal.

[This information was extracted from an article written by W3IWI, WA4SIR, and W3XO and published in the March 1990 issue of The AMSAT-NA Journal]

SB ALL @ AMSAT $ANS-146.05
AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 146.05 FROM AMSAT HQ
SILVER SPRING, MD MAY 26, 1990
TO ALL RADIO AMATEURS BT

Transponder Schedule for AO-13 Effective 05MAY90

The present transponder schedule for AO-13 is as follows:

```
         Mode-B          : MA 000 to MA 100
         Mode-JL         : MA 100 to MA 125
         Mode-LS         : MA 125 to MA 130  (Mode S Beacon only)
         Mode-S          : MA 130 to MA 135
         Mode-BS         : MA 135 to MA 140
         Mode-B          : MA 140 to MA 256
         Omnis           : MA 220 to MA 040
```

The best estimate of the current attitude is:

BLON = 180 and BLAT = +3 for 05 May 90

Cross mode B and S QSOs are possible during MA 135 to 140.

AO-10's Mode-B Transponder Now Available for Use:

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

[AO-10 update received from Graham Ratcliff, VK5AGR, via AO-13 beacons.]

FIFTH ANNUAL AMSAT-UK COLLOQUIUM

HR AMSAT NEWS SERVICE BULLETIN 146.06 FROM AMSAT HQ
SILVER SPRING, MD MAY 26, 1990
TO ALL RADIO AMATEURS BT

AMSAT-UK Sponsors 5th Annual Satellite Colloquium at U. of Surrey.

AMSAT-UK is sponsoring a symposium dealing with all OSCAR satellites and digital communications. With the recent launch of the MICROSATs, UOSAT D & E, and FO-20, OSCAR enthusiasts should find this year's meeting particularly interesting. Questions & Answer sessions with various Amateur Satellite and Packet experts are planned as are tours of the UoSat command station. As in years past, the University of Surrey will be the meeting place for this colloquium. The following is the "line-up" of programs planned for the week of July 26-29:

Thursday	July 26th:	International Satellite Day
Friday	July 27th:	Introductory Satellite Sessions
Saturday	July 28th:	Advanced Satellite Sessions/Packet
Sunday	July 29th:	Advanced Satellite Sessions/Packet

If you are interested in finding out more details concerning accommodations and the programs to be presented, contact:

Ron Broadbent, G3AAJ
94 Herongate Road
Wanstead Park
London E12 5EQ England

Tel: 081-989-6741
Fax: 081-989-3430 (24 Hours)

Information is also available on the DRIG BBS and the Hamnet Forum of Compuserve in Data Library 5. The file name is UKCOLL.TXT. It is in MSDOS text format. A file in Wordperfect 5.0 format, named UKCOLL.WP5, is also available in the same data library on Compuserve.

Note that the area code for AMSAT-UK has changed. To use AT&T in the United States to call AMSAT-UK replace the 081 prefix with 011-44-81. Contact your long distance carrier for their international dialing instructions.

[ANS thanks Ron Broadbent G3AAJ and Eric Cottrell WB1HBU for this bulletin]

Subj: Concerning changed BIDs

Some of us who post these bulletins onto the packet channels have been taking a lot of heat because some stations, somewhere are changing the BIDs, creating un-necessary duplication of the @AMSAT bulletins. I had complaints from Washington state, Costa Rica, Delaware, Wisconsin just today. Here is the text of a packet bulletin I have circulated about this topic:

SP SYSOP@AMSAT < W3IWI $14001_W3IWI
Concerning @AMSAT BIDs
R:900526/1826z 14001@W3IWI.MD.USA [Balto/Wash MD/DC/VA/DE] Z:21029

Concerning @AMSAT dupes and their BIDs: The @AMSAT bulletins originate (usually on weekends) on a non-amateur channel and are fanned out to regional distribution points with a standard BID like ORB-139.M or ANS-125.03. The local gateways (including KD9QB, W3IWI, N4QQ, WA4ONG) all post them with the same pre-assigned BID but with their own call as the originating station. Any you see with BIDs like 12345_W3IWI or 23456_KD9QB have been changed somewhere!

The past couple of weeks (and for the duration of the WA4SIR STS-35 flight) you have also seen some SAREX @ AMSAT bulletins with BIDs like SAREX.008 originating here at W3IWI. Occasionally (like right after a launch) you may also see some @AMSAT bulletins with "hot" news originating with non-standard BIDs, and some @AMSAT bulletins from elsewhere (like Europe and Australia) may also "leak" into the system with non-standard BIDs.

It appears that some BBS stations have their software configured to drop the original BIDs under some conditions, while others have their software configured to reassign BIDs (or MIDs=Message IDs) based on the forwarding headers in a message. It appears that AA4RE's REBBS and WA8BXN's MSYS code may have some options which may permit this to happen. No problems have been seen that could be traced to WA7MBL, W0RLI, CBBS or PRMBS BBS code.

The problem is serious -- some weeks I have seen as many as 3 or 4 copies of some @AMSAT and @ARRL bulletins make it into the system. Please review your BBS software configuration options and make sure that you are not the unwitting source of problems.

Tnx & 73 de Tom, W3IWI

I would suggest either an epoxy-polymide base paint or a polyurethane (poly-u) commonly called by the trade name of Imron. Poly-u is rather hazardous to your health if you happen to inhale it... like it coats your lungs and then you die by suffocation. I won't bore you with a lot of horror stories, but it is dangerous if you are careless, so be careful... enough said.

Neither of these paints contain any form of lead base or anything else that will screw up RF with the proviso of the pigment. Some colors contain lead and WILL cause weird things to happen. We have used these paints on aircraft antennas that operate across the spectrum (well, at least up to about 20 Ghz) with no measured ill effects.

Commercially, ask for Imron, but be careful to study the contents of pigmentation.

I have a Plymouth Voyager, and mounted a Larsen dual-band (2/70) antenna using the "L-bracket" on the front hood of the car (directly opposite to the van's broadcast band antenna). The coax is easy to snake into the passenger compartment through one of the firewall feedthroughs. The biggest difficulty I had was physically mounting the rig: my van has the "console" option, which doesn't leave much room for a radio. I have it mounted just over the drivers right knee, which seems to work OK (but you need to use care when mounting it to give it adequate support, and keep it insulated from the car electronics). Other hams I know have mounted theirs on the drivers chair. My only problem now is a spur created by the car electronics on 146.52 (you can pick this up quite well on caravans/voyager from quite a distance with your HT!).

One afternoon, while driving home (on an interstate toll road), I was being held up by someone driving UNDER 55 in the left lane. I flashed my lights at the driver and was ignored. I did it again and was still ignored. The third time (I avoid passing on the right since I consider it very dangerous) I was not ignored. I was flipped the bird by the passenger.

Well, that was enough so I started to go around on the right. As I drew beside the car, I noticed that the passenger noticed my strange antenna on the roof. (I have a dual bander in the car and my antenna is actually two short whips on one base in a "V" shape.) I QUICKLY reached for my microphone and started (from her visual perception) describing the car in detail. She could see I was talking on the microphone and she could see that I was looking very intently at parts of the car but she couldn't see that I didn't have the mic keyed. After "describing" the car, I backed off to "get the license number" and report that. When I dropped back, she QUICKLy moved to the right lane. She must have thought I was the cops or something.

Yes, indeedy, there is a N3RD. Dave Hawes who once lived a block from
me holds that call. He *IS* active in DX.

Here in the "Nawtheast" the band opened up on Sunday afternoon for the first time. W1JR managed to work a VP9 and FY, but the W2's had a much better day, working Cuba, Uruguay and Argentina. On Monday, LU2DEK finally broke through the W2 curtain (about 55 here), as did a couple of CO2s (CB and KK). There were also reports of W7s (double hop). Yesterday afternoon was poorer, didn't hear any SA, but did work K1FJM in Miami with great signals. This is in addition to the 'normal' stateside E-skip in the evenings.

jim, AD1C

I was going to email a reply, but this warrants wider distribution. Please don't use the word "fit" to describe an epileptic seizure. It's an archaic term, a vestige of darker times when epilepsy was seen as more sinister than it is today.

Of course, it's only a matter of time before the USSR issues:

RG8U

I don't remember seeing it in the '90 CB, and, forgive me, I can't remember where UG* is right this moment (Georgia?).... I do remember a friend (not me, of course) goofing off at Field Day a few years back, passing out QSOs at 4 am on 40 phone from RG8U in the Coaxial Islands....

>I turned on my kenwood Th215 the other day and got no audio from the speaker.
>The earphone jack still works but I hadn't used that before the speaker died.

I have not had exactly that problem, but yesterday I had to replace the volume control on my 215 for the THIRD time. The first time was under warrenty, but not the last two. The problem is that the only mechanical support for the volume (and squelch) control is from the leads soldered to the PCB. In each case, the control developed a hairline crack in one of the leads. This time, when I replaced the control, I used a hot glue gun to add some support.

Has anyone else had this problem, or am I just lucky? One of the guys at the local ham store told me that Kenwood had this problem, as well as a problem with the PTT switch, in the 215. He said that they supposedly fixed them in the 225. Any truth to this?

As a side issue, can anyone tell me the difference between the 215 and the 225? The ads look almost identical, except that the 225 is rated for 6 watts when run from an external power supply.

The following was received from KA5FYI (Austin, Texas). I have sent a copy to a friend at the local power company:

TIPS FOR FINDING LINE NOISE

The City of Austin Electric Utility Department (397-1433) will look for and repair sources of radio noise provided the noise source can be found and that it is caused by equipment owned by the City. This process can be greatly speeded up if you perform as many of the following as possible and have a good idea of the noise source from your own investigation.

1. CHECK YOUR SHACK AND HOME FIRST

Kill the power to your house and listen on a portable receiver. Test the individual loads if necessary.

2. LOCATE THE GENERAL NEIGHBORHOOD OF NOISE

A low-frequency radio like an A.M. radio can be used to find the boundaries of a large area that is noisy.

3. WALKING DIRECTLY TO A SOURCE USING ONLY AN A.M. RADIO

Sometimes it is possible to use the null position on an A.M. portable radio and walk directly to the source. Walk in a direction that parallels the axis of the rod antenna. If noise standing-waves are present, this method will not work.

4. SWITCH TO A HIGHER FREQUENCY

The higher the frequency on which the noise can be heard, generally the nearer you are to the source and the more direct will be the radiation from the source.

5. USE A BEAM ANTENNA ON THE HIGHEST FREQUENCY POSSIBLE

If the noise can be heard on VHF (2 meters) and you have a beam antenna and a portable rig (transmitter hunters), then you are all set up to pinpoint the noise source. Even FM rigs indicate noise on their S meters. Also try your 10 meter beam antenna to find the general direction of noise.

6. FREQUENCY CHARACTERISTIC OF THE NOISE

If the noise can be herd loudly on 80 or 40 meters and very weakly on 10 meters, the noise may be blocks from you. If it is loud on all bands it is probably nearby. If it is loud on a higher frequency band like 15 meters but cannot be heard on other bands, then the noise is radiating from a metal object resonant on that band.

7. PERIODIC NATURE OF NOISE GIVES CLUES

If the noise comes on at a given time, it is probably not power line noise; try to find the culprit by observation.

8. THE SOUND OF THE NOISE GIVES CLUES

A sharp-sounding noise that a noise-blanker handles well is probably a shunt discharge to ground (lightning arrestor or leaky insulator). This is a low-current leakage (it would blow up with high current) through a high resistance go ground. An exception to this is a sharp noise that comes from a loose ground connection. A soft buzzing sound that varies considerably with time indicates a bad connection with a relatively high current (a bad switch or connector).

9. VARIATION WITH WIND AND RAIN

If the noise stops with rain, it probably was caused by a bad switch, connector, or a very slack span of bell insulators. The rain fills the microscopic gap, thereby extinguishing the arc momentarily. On windy days a noise source may vary with the motion of the conductor in the wind. Either of these eliminates the source being a leaky lightning arrestor.

10. SLOWLY PULLING ELECTRIC GUY-WIRES YIELDS INFORMATION

If pulling hard but smoothly on a guy wire on about 2-second intervals causes the noise to drop in and out, it's time to call the Electric Utility.

11. THINK SAFETY FIRST; NOISE IS SECONDARY TO LIVING

Be careful around power lines. They can produce as much power as a dynamite explosion under a fault condition if it occurs near a substation. Do not use ladders, poles, etc. to touch any 'hot' elements. Watch for anything else that might come in contact with the line, such as a tree. Also, the noise could be caused by loose hardware hanging and touching something that has high resistance.

12. NOISE IS 99.9% CERTAINLY NOT FROM A TRANSFORMER

They self-destruct if noisy enough to be heard.

....K5GP

Hello net, I'm searching for a copy of a program which was popular in the early to mid 70's. It would take a line of characters destined for a printer and convert them to braille characters in a 2x3 pattern of periods which after multiple strike-overs could be read as braille through the back of stiff paper. An impact type printer like an old ASR 33, or IBM selectric was required, but the end result was tolerable braille output. These old printers often are sold at ham fests, I've had requests from several bind hams for software to do this type of conversion. If you have a program like this for general distribution, I'd truly enjoy a copy. Thanks.

>Yup.. my good friend contracted the call. :-)) To add misery
>to this story, he works in the local hospital as a surgical
>technician.
>By the way, he applied for a change of call from the FCC citing
>that he thought it was "disgusting". He did get a new call:
>KE9VV.. humm the beginning of a exam!! ;-)))

Wow...funny this would pop up - I just worked KE9VV on 10M recently. If I'd have known about this, I would have suggested he keep KE9VD. Here's why:

Some years ago, I used to work Field Day with the La Porte, IN, club, call K9JSI. Used to be great fun, mostly because the group of guys were really nice folks - there weren't any overbearing snobs involved with the contest stuff.

At any rate, this particular FD there was quite a nice opening on 40M somewhere around, oh, I'd guess about 3AM. Stuff rolling in from about anywhere.

Upon having more or less established a frequency and becoming the center of a minor pileup, we called, once again, "QRZ - here is K9JSI" and got called by (I think this is the right call) W2SEX. Everybody in the tent laughed and the op. at the time (I was tracking dupe sheets) asked, "have you contracted, er, contacted W4VD yet?" (we had and thought it an amusing co-incidence). He said no, and immediately we heard W4VD, who was still listening to our pile-up, come back - they completed an extremely funny contest QSO and would have gone on their respective ways were it not for the relative anarchy of probably 100 stations all calling at once asking "may I contract W4VD?" and/or "we'd like some W2SEX..."

K9JSI vacated the frequency for them. :-)

Disclaimer: Not having the K9JSI log sheets available, I am *not* 100% certain about the callsigns. It *was* 3 AM, you know... :-)

Gosh, WB9JLH was one of the other fellows, but that call isn't in the database. Shows KD9FG - wonder if it is the same fellow.....

HST uses the Tracking Data Relay Satellite System (TDRSS), which is encrypted (with something presumably stronger than DES). It would be the proverbial good thing if someone at STSCI would make some of the images available via anonymous ftp....

I used to qsl 100%. After 9 months of operation and qsl's to a number of
European and Japanese stations/managers/bureaus who haven't seen fit to
respond, I've reduced my qsl-ing to 100% U.S., where I get about 65 percent
return.

I've always felt that the qsl was a neat little courtesy that you extend to
other Hams whom you've not worked before; not a means to finance your station.

As for me sending blackmail money to get qsl cards back; well, forget it! If

I don't get theirs, it's no biggie. I got 'em in my log.

No, you don't owe me your qsl card, even if I send one to you. But

I have a Drake TR-4C (my first HF rig--purchased a year ago in November) and as it was my first rig, in learning to tune up, etc. the finals have been through some torture. Does anyone know of a good source for tubes of all kinds, especially the 6JB6s. I need three and they must be matched. Drake wants about $26 apiece (double their price a year ago!).

As an example of the wear and tear these tubes have seen, when I first got the rig, I was able to get out over 100 W on 10M. That's now down to < 25W on a good day!

On lower bands (15,20,40,80) I was able to get out over 200 and am now down to < 150W. Not too bad, really. But under 25 W doesn't cut it for me on 10M.

The Drake is capable of over 300 barefoot, so you can understand my interest in new tubes! At least now I can tune up quickly and properly, so the old finals served their purpose.

Donations will be accepted!! :-)

Thanks for your help, as usual.

N9FZX told about being pulled over by a ham/hiway patrolman who wanted to use his two meter radio.

Last year I was on my first date (and last) with Heidi, and she was kind of wondering about the antennas on my car. We were headed down Roosevelt Way in Seattle, when I saw flashing blue lights behind me. I got out of the car to meet the Seattle police officer. He had just gotten his ham license, and all he wanted to know was what kind of radios I had in the car!
We chatted for a few minutes, and then I was on my way.
f
I think after that Heidi KNEW we
hams were crazy.

I have quite a bit if Andrew Twinax (no number on it, sorry) that's 100% shielded, foam, and a center conductor of more than 1/8 inch in diameter.

The shielding looks alot more like conduit. I know it's for microwave, basically no loss, quality cable.

But, since I don't own a microwave tower and dishes, waveguides etc...and have no plans to, can I use it for regular applications? I'm not worried about the cable, the way it's designed it could be used to carry AC to the house, I just don't know the ratings of such monsters, dielectric/impedence/etc...

I can load it for 50 ohm if need be, yes, I know it would be over designing my antenna system quite a bit, but I rather use it than sell it off, if I could find someone interested in such a small quanity, when utilities buy it in 2000 foot bolts.

Ideas? (Constructive) Comments?

I have a callsign server that responds to mail requests. To access it,
send mail to callbook@sat.datapoint.com. In the body of the message,
include a line with the word "lookup" followed by one or more callsigns.

For example:

     lookup n5lyt w5ifp kz5zzz

For more information, include a line with the single word "help".

The database is based on September 1989 FCC records, but does not
include club stations. U.S. callsigns only, of course. I intend to
update the database each year.

Currently, you can lookup by callsign only. I hope to add other
search criteria in the future.

I've noticed a running series of messages concerning short or odd ham calls.
Here's another. Looking through the RSGB Call Book which I bought a couple of
weeks ago at the RSGB VHF Conference, I came across a list of VHF/UHF ham
beacon stations. It lists a number of those in the US, but also a lot we don't
ever hear this side of the Pond..... one of which is ---   I5I   !!!!
That must hold the record as the shortest ham call.
Full details are: frequency 1296.855 MHz   location   Pistoia (Italy)

Grid locator JN53LL   height asl 550 meters   antenna 4 Mini wheels
ERP 10 W
Can you top this?

I don't think that's correct. I believe the Presidential helicopter is flown by the Marine Corps and is called Marine 1.

I tried looking this up in a couple of references that I had handy but couldn't find anything either confirming or negating. Does anyone have a better library?

>
> Tell us about this secondary market (or e-mail direct)!

Well, here we go. Several places often let you know that they have IRCS available. the W6GO list often has them, and I just saw a note a few weeks back that Joe, W3HNK, perhaps the most famous QSL manager in the US, had some. First, both ask 50 cents for an IRC, not 40.....and I believe both are out at the present. There is a guy in VE land that sells them as well, but I think he wants 55 or 60 cents each. Basically, the post office gives you 40 cents for each one....they cost 95 at the post office, thus the 'secondary' market.

I sometimes have them in 'limited' quantities of a few hundred or less, as most of the DX QSLs I get seem to have GreenStamps (i.e., $1.00 bills). Send me an email if interested.

Fred requested A-B comparison of the IsoLoop with anything else...

I'm deveoping a bicycle-mobile system, and am thus constrained to things I can carry. My wire dipoles have thus been left out of the testing, and I don't even want to know how a beam compares.

My A-B tests have been against a mini-dipole made out of Hustler mobile resonators (2 for each band) and a pair of MO-4 masts. This assembly is much more portable and packable than the IsoLoop, but operationally, it's not so simple.

The basic trade-off is gain-bandwidth. The IsoLoop is EXTREMELY narrow, requiring tweaking with almost every change of the VFO. Using an Icom 725, this requires switching to CW, turning power all the way down, and sending a carrier while watching SWR and nudging the stepper in the antenna. Not a long process, but a bit of a nuisance... and it could very easily be automated (derive DC from an SWR bridge and drive the stepper until it is lowest; interpolate between band edges if using computer control of the radio and output stepper pulses at the same time; etc).

On 20 meters, the IsoLoop receives consistently better reports -- like the difference between 54 and 59. On 10 and 15, they seem similar, though I seem to have better subjective penetration of the QRM with the loop but less effort working with the mini-dipole. I've been using the loop in horizontal (omni) mode with the coupling loop at 45 degrees.

I've been thinking of packaging options, including increasing the size of the loop to include 40 meters (and match the solar panel array on my trailer). But it's heavier and requires more setup effort, so in my particular application it may not be optimal. But after this testing, I can easily recommend the IsoLoop to anyone with limited space or more conventional mobile needs. One big plus is that it's ALL BANDS between 14 and 30 MhZ, including 17 and 12 meters. With the other approach, I need 7 pairs of resonators.

CHeers and 73...

I used to send $40 and a few stamps to KX6DS's QSL manager and get 100 IRCs back. I have done similarly with managers for other operations.

Often there will be ads in DX bulletins from W3HNK or somebody who is selling recycled IRCs for $0.50. This still beats $0.95.

I have neither bought nor redeemed an IRC through the post office. I view them as ham currency. Of course, for all I know this is probably against the law or something. Sillier things are illegal.

Personally, I operate lots of contests and consequently get scores of IRCs in a given year. As few cards as I ever initiate any more (I'm too lazy), the incoming supply is adequate for me.

In Part 2 of the FCC Rules and Regulations is where allocations are made. Frequencies are allocated to services as well as call signs. It just so happens that the call signs K0A-K9Z, N0A-N9Z, and W0A-W9Z are allocated to the Amateur Service. There happens to be not policy of issuing them, but if they decided to do so, the rules are in place and they could do so w/o a rulemaking proceeding.

> of the "full" licenses as incentive to learn more technically. The full incentive licensing program, established in the late 50's or early 60's, established the present five license classes that tied more privileges to demonstration of more knowledge and skills.
>
>
> 73 de Scott KC1ST (ex WN1TEW)
>

Actually, incentive licensing became reality in November, 1967. Prior to that, full privileges were conveyed by the General/Conditional Classes. (Does anyone recall the Conditional Class? It was equivalent to a General-Class license, but it was taken by mail. It was available to those who were physically unable by virtue of disability or distance to present themselves at a place where the FCC held amateur exams at least quarterly). The Amateur Extra Class conveyed no special privileges, only a warm, fuzzy feeling and a blue-and-white diploma-like sheepskin (suitable for framing) that resembled the diplomas the FCC gave for Commercial Radiotelephone/Radiotelegraph licenses. At the time the FCC adopted incentive licensing (late summer of 1967), there were about 5,000 Extra Class licensees out of an amateur population of some 250,000. Please don't hold me to that statistic, though; memories THAT old rely on residual magnetization of the old cores :-) :-)

The old Class A was rejuvenated and re-named "Advanced Class" in November, 1967; I recall going to Chicago just after Christmas of 1967 to take the Advanced exam, just a month after the class was re-opened. The first restriction of privileges to persons other than Extra Class licensees took place in November, 1968; the second restriction, which established the subbands in largely the form in which they exist today, took place in November, 1969.

My privileges were restricted for a while, because I could not take the Extra Class exam until August, 1969. At that time, an applicant (or was the correct term "supplicant?") for the Extra Class had to have accumulated two years as a licensee of the General Class or higher.

Anyone else recall those old Extra Class diplomas?

One night last summer, a friend of mine and I were out performing car acrobatics. I ended up with a tailpipe stuffed with a few inches of hard-packed dirt (DON'T ASK!!)

Digging it out with a key was a long, slow process and it was getting nowhere fast. We decided to make our way to a wild party we could see from the street. A few girls were yelling at us from there. So, we drove over to the apartment and knocked on the door several times to ask for a butter knife. (Pretty unusual request, eh?)

The door was answered by a few drunk types who weren't very happy to be disturbed. Of course, they were not to be reasoned with. They began to get somewhat unruly and started speaking about violence (not realizing that my friend was a student of the martial arts). I very casually walked over to my car and keyed up on 147.14 and listened to good ol' WB5KFJ the talking repeater with the volume up loud.

The drunks practically came unglued! There were several minors at this party and they thought we were cops!! Things settled down VERY quickly, and we left without further incident. Ham radio saved the day!

So... let's hear your stories about how you were rescued from various real and not-so-real emergencies thanks to the radio. I carrry my HT with me EVERYWHERE I go, and people give me a hard time about it. But I know that it will come in very handy someday when there is some form of accident or other incident that precludes my getting to a telephone.

I KNOW this will make for some interesting reading!

Lest anyone get confused by the similar numbers: the 7600DS is a different radio from the new 7600 (no suffix). The 7600, which replaces the 2002/3, is compatible with stereo phones -- no adaptor needed.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

There was an article in one of the aviation magazines a few months ago
that featured a family named Bird; all of their aircraft were registered
as Nx81RD. One of their helicopters even had the 8 modified to look more
like a B.

I would like to paint my HF beam with some camo-colors so as to
reduce its visual impact. I tried this once before with a 2-meter
beam, and the effect was stunning - the antenna just disappeared.
I should mention that the only angles at which it was visible in
the first place were from a long distance, horizontal, with mountain/
folliage backdrop.

The problem is that the paint apparently had a significant dielectric
effect, screwing up the antenna. I certainly don't want to mess up
my HF beam!

Does anyone KNOW where to get paint with minimal effect, that can be
applied directly to aluminum radiating surfaces? Does anyone know what
this stuff is called, or specific brands?

Does this mean that some people with the proper equiptment could intercept digital image downloads from the HST, (in the future of course)?

Years ago you could request a "custom" call for $20.00. I think you
had to be General class or higher to do this.

For a period in the 1970s if you upgraded to Extra, you could choose
a 2 letter suffix of a 1x2 call to your liking. My pal K7JCA chose
K7SS, because it was snappy in contests (especially ARRL Sweepstakes).

If anyone knows of mods to the Radio Shack Pro-38, would you please mail them
to me? This might even be of general interest, since I could not find them
on the hamster archive. I'm particularly interested in adding 800 Mhz coverage,
adding 66-88 Mhz, and expanding the channel memory. Responses which say
``you can't do that'' are also welcome.

Thanks.

I met a fellow recently who carries his HT with him on his belt loop like
an official looking person. Both he and his wife have tickets, so when
he is out and about town he can contact her via a local repeater. So
his HT is basically a cellular phone! (Actually more truth to that since
the repeater he hits has an autopatch).

Boy, you must really have trouble with the managers who accept direct cards, but only reply via bureau.

> a 25-cent stamp. Say he handles QSLs for a dxpedition and gets 1,000
> cards from U.S. hams with a green stamp. He spends $250.00 for stamps
> and keeps $750.00. This is more than a making a little money. I have

Are you ignoring the postage from Finland to California? In case the cards were hand carried to California, the round trip air fare?

What is this really costing you? You sound as if you would be happy if the manager had spent all your money on postage. Why not just be happy you got the card?

> If QSLs are to be mailed back from the U.S., the QSL information should
> include the fact that an sase should be sent with the card. I have no
> problem with honesty, but do have a problem with deception! It is good

This information is not always known before or during an operation.

I'm thinking about writing the ultimate contact log program in Turbo C.

I would like to take ideas about what the program should be able to do. Send me your ideas by direct email, please. This should be fun.

>Is I5E the shortest possible ham call on CW?

Given current ITU/ICAO callsign block assignments, yes. The only shorter
ham call would be E5E, and there's no current assignment for the E5A-E5Z
block.
I don't know if the Italians would assign it, though.

> And 0Q0QJY the longest?

Again, assuming current callsign block assignments, this one's not
valid. I don't believe 1AA-1ZZ is assigned, either, so that makes the
longest calls [JY]00[JQY][JQY][JQY]. I think Y0A-Y0Z is assigned to the
DDR (for now), but can't guess about J0A-J0Z.

How was your WPX CW Contest? At this location things were lousy. It seemed as
though I was in a BLACK HOLE. About 2050Z on saturday there
was a complete blackout of everything from DC to light. For about 45 mins WWV on
all frequencies was completely wiped out. There was not
a single amateur station to be heard on 14/21/28. During the whole
time of the contest I worked every european station I heard - six
stations - 2 DJ's, 1 G, 2 YU's and 1 Y41. Not a single OK/LA/ON/OH,
etc was heard. Even more dissappointing not a single JA was heard.
The contest at this location (which is about 300 miles north of the
North Dakota - Sask border) was very, very bad. Just for the fun of
it I tried to work as many state side and SA stations as I could.
My approx 20 hours of effort yielded 245 QSO's - I can normally do that
on a good sunday afternoon. Did any of the rest of you experience
a similar WPX contest?

I am interested in setting up a packet radio station. I plan to operate
both HF and VHF. I may also want to operate RTTY. The transceiver end

will be a kenwood 440s or a kenwood 2m HT. The computer is a mac plus.
I am looking for hardware/software recommendations and advice.

Interesting TNC/Data controllers include:
MFJ 1278 (Data Controller), 1270, 1274 (TNCs)

AEA PK-232 (Data Controller), PK-88 (TNC)

Kantronics KAM (Data Controller), KPC-4, KPC-2, KPC-2400

I will attempt to buy the equipment used so please note any problems of early models.

If you have any recommendations or advice please send me mail. I will summerize for the net.

Greetings:

I just found a Hallicrafters SX-122 sitting in the trash. I want to revive it for old times sake (been a ham since these things were state of the art....)

Anyone have a manual or schematic for this radio? I would be thrilled to find one.

 (WHEW!)

Thanks for the pat on the back John! You bring up a good point.
However, this happens quite often. For example, some guys do this,
who manage their own qsl cards, to 'fund their dx-peditions. While
I don't know this for sure, i believe ZL1AMO does this, as each card
I have sent him comes back with a us stamp. Worse than this, is the
F6 manager who requires 2 bucks for airmail reply. send one buck,
and it comes back via the buro, send a sase, and it gets trashed. I
believe this is what is happening, and has been written up in many
dx magazines. Some awards will no longer accept his qsls any more!

I guess it would be interesting to find out what happens to
the 'difference' between the money you send and the us stamp that is
used. If it goes for a 'good purpose', i.e, other than lining ones
wallet, then I suspect that, if the delay incurred in making this
happen is insignificant, maybe it is ok. I know that, for a dx
station to get a card from me, two ircs are worth 80 cents at the
post office, and 1.00 in the ham market. the stamp is 45 cents for
return air mail, and the card ranges from 2-4 cents. If
a 'donation' is included (i.e., more than 2 ircs, etc..) i usually
include a note and a picture of the ham, or some such thing. I keep
pretty accurate records, which is easy once you organized to do it
(which is a must for QSL managing!).....and as I mention before, use
it to help the dx ham out. For the garden variety dx i manage,
i.e., 8p6 and ti, i run in the red.....as some stations do not even
include sases. For the xx9 stations i manage, they generate money
in the 100's of dollars when active. thus....purchases of
significant equipment are possible. You can argue whether this is
the 'best, or appropriate' use of the money, but it seems that any
other use would come under more fire!

cheers, and thanks for the kind words for QSL managers in

general..for the most part, they are a GREAT group of people.
Consider the XX9 station i manage for, before me, hadn't answered a
QSL in 3 years! I carried over 7000 qsl cards back from my first
trip there...

If the data is scrambled properly, it is virtually assured of self clocking. It really does not matter if you rotate your relative angle each time you transmit a symbol; there is still a chance that some data will lose clocking on you. In the unscrambled case, consider 0000 in both absolute and relative angle systems. If not 0000, then whichever symbol will result in no angle change. With scrambling, though, it probably does not matter.

> Also, the 4x4 grid isn't quite square; it's more of a pincushion.

I would guess an array of points in a hexagonal arrangement would be ideal, but the circuitry would be more complex. Think of the problem as packing a number (in this case specifically 16) small circles in a larger one. Add to that the mathematical formula for deriving the circle id from a coordinate in the larger circle needs to be as simple as possible.

When I played with the FT-736 at Dayton 1.1 years ago, it tuned through the
220-225 Mhz band just fine.  Kenwood and Icom didn't see fit to consider the
non-Oscar VHF DX-er.

> gots'ta know....See ya on DaveTV (427.25, 439.25)

They are also mentioned all over the place in (as far as I can tell) every radio service. So far I have not found the actual definition of damped waves, but I'm guessing it is spark-gap. The "damping" is the filtering used to select a frequency of a broad nature. I supposed if this is the case, one could argue that the non-coherent radiation from an incandescent light bulb through a narrowband Wratten* or dichroic filter would be prohibited by this.

[*Wratten is a trade-mark of Eastman Kodak]

In article <30500554@ux1.cso.uiuc.edu>, phil@ux1.cso.uiuc.edu writes:

> > I suspect that what you heard was an image frequency...
> 407.750 + ( 2 * 21.4 [a common IF] ) = 450.550 [a common radio remote link]

In an earlier posting, I suggested Charlie heard a spur rather than an
image.  An image seemed unlikely given that the BC-210, R-7000, and
MX4000 have different IF frequencies.

Perhaps Charlie could reiterate whether he heard the signal on
all three receivers.

If you can not detune Apple II's clock oscillator (because of NTSC monitor), try putting FR chokes to all leads coming out of the Apple II main unit. There are quite good two part put together chokes made by Amidon Associates, Inc in the USA. Using these there is no need to remove any connectors or cut cables. Put whole cables thru chokes as near as possible to the Apple II main unit. Ask help from a radio amateur or look up some book on RFI.

I have a Ford Aerostar that had exactly the same problem. What I did was use a 1/2 wave glass mount antenna. The Aerostar has small triangular windows between the doors and the windshield. These are windows are low (and thin). I mounted the antenna on the drivers side window. Now, this installation isn't optimal. The antenna runs very close to the door pillar and protrudes only a few inches above the roof line. Also, I can't run more than 15W without affecting the electronic instruments (which aren't far away). All things considered, it works pretty well.

Well, two unusual occurances in San Diego yesterday--it rained almost an inch (probably hasn't rained in Southern Calif. on Memorial Day for 50 years) AND the TV was hopping with E-skip all day long! The 6-meter guys were going nutz with working rare grid squares, too.

Over the course of the day I logged:

KUSD 2 Vermillion, S.D.
KXMA 2 Dickinson, N.D.
KMID 2 Midland, TX
KTWO 2 Casper, WY
KBTX 3 Bryan, TX
KSNW 3 Wichita, KS
KENM 3 Portales, NM
"Prairie Public TV" on channel 3--don't know where.

And there was lots of other stuff, too, incl. channels 4 and 5. But I couldn't stay glued to the TV all day!

Anyone else have some VHF fun yesterday?

Our local 2m repeater used to be housed in the elevator-machinery room of a building on the local university campus. The door to the room was at the top of a stairway that went nowhere else except a locked roof door.

One early Sunday morning, a ham went to the repeater site to make minor repairs. He carried his h-t on his belt. When he arrived at the machine-room door, he surprised two students smoking dope.

"You're a plainclothesman, aren't you?" one of them asked.

"Well, yeah, I've got my plain clothes on."

"Will this be alright?" asked the doper, handing him a $20 bill.

"Sure. You boys be careful, now," he said as they departed.

That's a common misconception. Scrambling has no effect on whether a code is self-clocking. All it does is change WHICH user data pattern causes absence of clocking.

Unfortunately this mistake is common in certain parts of the communication industry. The reality is that the ONLY way to have guaranteed clocking is to use a code that has minimum transition density guarantees. For example, FDDI is self-clocking; SONET is not.

I ordered a Heathkit TNC in early April and today the order was returned with the announcement that all Heath Canada stores except Mississauga are closed and Mississauga is gone by July. I was referred to Benton Harbour.

Apparently Heath Canada was not unsuccessful but is more a victem of the new Corporate masters. Something like Studabaker.

Is this the beginning of a trend? Is Heathkit marked for execution? I know that Heath is no longer the major force that they were in the fifties through early seventies but I would still miss them.

The homogenization of planet earth.

Last summer, I drove from California to eastern North Dakota. While passing through Bozeman, Montana, I decided to fire up my 2m handheld, and see if I could get into the Bozeman 2m machine. So, with a QSO in progress, I look in my rear - view mirror, to see a Montana HP car with his lights on. Having been through the routine before (owning a performance car has its problems), I pulled over, and reached for the registration stuff. I noticed that the officer wasn't carrying anything, so maybe I was going to get off with a warning. Down goes the window...

"Hi Officer. What can I do for you?"

"Could I borrow your radio?"

(Shock, relief, puzzlement...)

"Are you a ham?"

"Yep"

"What's your call?"

"N7..."

So, I hand him the HT. He brings up the patch on the repeater, calls his wife, tells her he's going to be a few hours late because someone didn't show for his shift, hands me back the radio, and says thanks, and starts walking away. He then turns around, and says:

"Oh, by the way, you really should get ham license plates. We generally don't pull over hams unless they do something really stupid."

Yep, needless to say, I now have ham plates.

I was walking along a busy street one afternoon when two cars hit nearly head-on. I whipped my 2m HT from my belt and walked out into the street to get a better look at one driver, who was dazed and bleeding, but apparently not seriously hurt. I autodialed 911 and had the report in within 20 seconds or so.

While I was in the street my wife overheard a bystander say "He must be a cop or something."

The funny part was that a paramedic ambulance, probably just leaving Cedars-Sinai emergency (half a block away), happened upon the scene almost immediately. The whole thing took less than a minute. By then, I was no longer a cop, but somebody *really* important, because when *I* called, they got there in a hurry!

>folks at amateur electronic supply?

David, I had the *exact* same problem with my brand new TH215A. I think I bought the thing about 2 years ago and when I received the radio, it was in perfect working order. About 5 days later, the speaker just cut out on me. There was still audio coming out of the speaker jack however. The remedy to this problem was to order a new speaker from Kenwood. The speakers have these hair-thin wires that tend to break very easily and I suspect that this is what happened to you. It is fairly simple to replace the speaker. Simply take the cover off of the 215, desolder and pry the speaker out of the front panel. Resolder and replace with a new speaker from Kenwood. You will want to apply some kind of adhesive to the edge of the speaker to firmly secure it back in place. It should only take you less then 10 minutes... The phone number for the Kenwood parts dept. is (213) 639-9000.

A while ago someone posted plans for a 2-meter J-pole. Then some one said "use a network analyzer to find the 50 ohm point" to which someone else replied "Ya, like we have one, dream on, dude"

Well, it just so happens I have one, well, ahave acess to one. Here at UW-Platteville, we have TWO HP 3577A (5Hz-200MHz) network analyzers (while I'm bragging, let me empisize that UWP is only one of 4 or 5 universities that has these for undergrad use, and i think the only one that has 2 and lets sophmores at them, also, UWP graduated approx 30 EE's this may)

(brag mode off)

We also have an s-parameter test set along with 50.000 ohm resistors
How do I use a network analyzer to find the 50 ohm point? I'm familiar with smith charts and the general operation of the machine, but since I'm a digital emphisis, I don't really have experience with doing this sort of thing. Could someone e-mail me some hints?
Something like "probe along until 146 MHZ crossess the r=50 ohm circle" would be great.

Thanks in advance,

Brian P. McCarty, N9IWP

One thing that you all haven't yet considered is that it was the second harmonic of the remote microphones that are used for studio work. Not having the exact channel frequencies before me, the remote mike stuff can occupy many spectrum within many different VHF TV channels, especially around 200 - 215 MHz. Sorry I can't be more exact...

I recently repaired a President model 2510 radio and promptly fell in love with it. Even though it is not the greatest 10 meter radio, it is a damn good one, and I have had some remarkable dx's with it. I am now in the process of buying one, and i need to know all the modifications that can be done to it. These are the ones I know of, the 11-meter conversion, and the power pod.
But i have just heard of these. If anyone could send me any information that they have i will try to post a modification on how to convert it to 100 watts am and 250 peak sideband.
please email any information, and if neccessary i will cover any postage for schemeatics.
i have heard that some of the mods were in mags like 73, so if you could at least send the issue number.
many thanks and 73's\

I am very interested in comparison type results with the new AEA Loop antenna verses anything else. I have read some good things about the antenna here but nothing comparing it side by side with other types of antennas, even a dipole.

Thanks in advance....Frank n2bqt

>
>But seriously, anyone know what the scoop is on this one?

I can speculate. It would seem that the proper thing to do would be to delete *both* PDR Yemen and (the other - is it Arab People's Republic?) Yemen and add a new country for the merged Yemen. Remember that Germany was deleted to make way for E. and W. Germany. I also suspect that when the two Germanys merge, we'll get *back* the deleted Germany, but E. and W. Germany will become deleted. Sounds like a net loss of 2 current countries (Yemen+Germany-DL-DM-4W-7O) and a net gain of 3 deleted countries (DL+DM+4W+7O-Germany) to me. But it'll only put me one country closer to the honor roll, since I've never worked either Yemen.

I do qsl cards for some 20 active stations. For me, as long as the
note contains the 'information on a qsl card' (i.e., I should be
able to use the note for an award if needed) then I am happy. Just
don't put the information buried throughout a 3 page letter telling
me about your life. I do 100 qsl cards every few days, so needless
to say, I probably won't get to that one!

>
> Do the stations worked ever get these cards? Do they even want them? If

```
> not, then we can save money by not sending cards.  If we work a station
> on several modes and or bands, do we have to send a card for each?  Again
> we can save money by sending a list with the info and not the cards.

Cards are not necessary, just convenient.  Just got a was award by
sending in a post card where someone carefully wrote out the qso
details longhand.  Stations sometimes get the cards, sometimes
not...it depends.  Usually, the dx station is casually, at least,
chasing some award or another.  If money is the issue, take your
card, or design a card, and go to a print shop.  size isn't too big
an issue...you can probably get 10 pseudo-qsl cards on a 8.5x11
piece of paper....and this will do for most purposes.

>
> If the operator worked really does want my card, then I have no problem
> sending mine, of course, but if the manager tips them, then it's a waste.
> With even simple cards costing 15 - 20 cents each, quite a cost saving
> can be had by using a list.

not sure where you buy your cards....but W4MPY sells something like
1000 'basic' qsl cards for $31.45 (see march/april 1990 National
Contest Journal, page 32 or write him callbook address).  These
cards are quite nice, and I see a lot of 'basic qsl' cards in the
managing business.  Thus, you can get away a lot cheaper than noted
above if you are willing to live with heavy card stock and one color
ink.

> Any QSL managers out there want to comment?

Being a QSL manager is a lot of fun, but also a lot of pain.  If
anyone has any other questions, fire away.  Probably the most
important rule is remember that QSL managing is a volunteer effort.
I suspect that one might make a 'little' at it, depending on the DX
station...but I doubt it pays for the coffee/beer/soft drinks
consumed, let alone the time.  I take any money gained and roll it
into the dx station in terms of new equipment, etc.  As an example,
I have furnished a good part of a satellite station in Macau over
the last year, buying amplifiers, etc in the used market.

> so there is a good chance that your request will relegated to the
> bottom of the processing stack. Furthermore, suppose that you work

Good points, Joe. Even more aggravating, not so much to me, but to the ham sending a qsl to a manager, is multiple requests in one SASE for MORE than one station. Then, the dilemna is, do I just send one, or wait until the logs clear for all the qsl cards involved. I usually do the latter, but this sometimes holds a qsl card for a few months. Remember, I wait to receive verification before I send you a card. SOmetimes this is over the air (1 day after receipt of qsl), sometimes via packet, sometimes via mail. Even though I 'keep on hounding' the guys i do cards for, some of them are somewhat slow. Thus, if you have two cards to send to me, and one (or both) are needed for an award and you are hot to get them, invest in two SASES. If I can verify both at the same time, you will get one SASE back unused.

Now that I am done, I will note that some managers REQUIRE a SASE or equivalent per QSL. I don't and I find this practice (of dictating) somewhat offensive, but the realities of life indicate that, if you are in a hurry, send a SASE for each card.

cheers

Just for pedantry, the angle is not normally the phase angle of the
carrier relative to some absolute phase reference, but the phase shift
between the previous symbol and the current one. That way the
modulation scheme is self-clocking.

Also, the 4x4 grid isn't quite square; it's more of a pincushion.

+
+Are there any mods for the Yaesu FT736R? I checked the mods
+database, but didn't see any. I'm most interested in extended
+receive, but if you know of any mods, I'd appreciate hearing about
+them. Thanks.

I modified mine. There's a catch tho - the mod involves adding a pair of switches to the module-address lines into each of the rf modules..it's kinda funky but it does work. Look at your schematic, then wire up the switches such that your 2m and 6m modules *think* that they're 440MHz modules! The trick then is to look at the display, which reads 443.000, and mentally adding 6.0 such that you know the real frequency is 49.000MHz.

Similarly, the display will read 445.000 when the 2m module is really at 145.000. When you finish adding the switches, you'll have to powerup the '736 with the switches in the 'extended range' position. Then use one of your existing memory frequencies, transferred to either the A or B vfo, to then bandswitch up or down to the 440 band. Bingo! If you goof, the display will read "error". Start over by powering down, and then repeat the procedure. Sometimes the frontpanel logic will simply lock, just start over and it will eventually work. Mine never takes more than 2 tries. With the switches in the 'normal range' position the '736 will function as a stocker.

The range for the 6m unit is therefore 46-56 MHz, and the 2m unit will give you 140-150 MHz. Yes, the transmitter will also work this span, but keep in mind a 10 watt signal on the 49 MHz band sticks out like a sore thumb! ;-) ("Wow! Listen to *that*! He must have a better walkie-talkie than these RadioShack junkers!") ;-)

My attempts to modify the range on the 430 MHz rf module have not meet with much success, and a careful look at the schematics/numbers tell the story quite well; The module covers 430-440, a 10MHz range. Therefore, the address-line trick will yield no more coverage. The base reference crystal might be changed, but then you'll have to tweek the coils to put it into resonance. I've considered adding a submini-step relay, a pair of crystals and a pair of extra coils. This would give the module 420-430, 430-440, and 440-450 as it's total range...I'll let you know if it works..or maybe you could try it and tell me!

You will discover (if you play with the address lines) that the front panel processor has code in it's ROM to display the numbers for 1.6-2.0 MHz, 3.3-4.0 MHz, 7.0-7.2 MHz, 10.0-10.5 MHz, 18.0-18.5 MHz, 21.0-21.9 MHz, 24-25 MHz, 27-27.5 MHz, 28.0-29.7 Mhz, 50-54 MHz, 70-71 MHz (really!), 143-149 MHz, 220-225 MHz, and the 2 ranges for the 430-440/440-450 Mhz bands. I know that Yeasu made an HF module that was able to do 20,15 & 10 meters, and that there was a module thta was available only-in-Japan to do the 70-71 MHz band. The 220-225 MHz range never wound up as an available unit. Too Bad! I'd guess that one could be constructed from a spare 2m module, given some extensive changes.

There is also the possibility of adding more modules to the '736! Yup. I've seen a couple that have a 4th module added 'outboard'. Look at the schematic, you'll notice that the module-select is capable of it, but watch the line lengths! It's also possible to add some more switches to put more than 4 modules on! Think of it as a shift-key...;-) My only lament in doing these sorts of things is the lack of a proper cabinet and/or overloading the poor power supply.

Have Fun, 73! C U on OSCAR!

Way back when you could request call signs if you had an extra, I went to the NY City FCC Office to take the extra test. It was only open from 0900 - 1100on Wednesdays, and it was quite an adventure for a 9th grader to get into the City from Long Island (I was licensed at 12, went for the extra when I was 14 OR 15), especially during the week when you were supposed to be in school. After walking to the Long Island Rail Road station instead of high school, taking the LIRR into the City, figuring out which subway line to get close to the FCC office, finding the FCC office, etc. I got there at 0915 and was told" "Go away, kid, we give the code test only at 0905 SHARP. AND WE MEAN SHARP. Thoroughly traumatized, I did get my advanced but it wasn't until I moved to Maryland 7 or 8 years later that I went back for my extra.

Which explains why, surrounded by great contest calls like N2FB, K3SA, N3RR, K3ZO, etc., I still have a humongous call like WB2EKK. I've had it now for 20 years (wow, I'm an old fart! QCWA here I come! I will soon remember stuff in the "25 Years Ago" column in QST) and it has sorta become like a middle name. I just can't convince myself to trade it in for NZ3Z. Maryland has just about run out of those calls and is starting in on WA3x type calls. If I could be assured of becoming W A 3 DAWG I might go for it, but until you can choose your own, I guess I'm stuck. I guess it will be many, many years until they actually run out.

By the way, local guys here who work at the FCC say the reason the buy you r callsign proposal was ruled out was because of the increase in manpower required to make sure that monitoring and field offices had the latest callsign info. sounds kinda hokie to me, with about 500,000 hams at 100 500 bytes per entry, that is still only a 250 MB data base. I think most high school hackers could handle that on their dad's 386 machines.

Oh, well, meantime my advice to you rare DX stations is to work all the long calls in the pileups first to get them out of the way. Then call the KM3T and K6ZHs of the world! 73 John Pescatore W B   2   E   K   K

As a new ham of 2 months (disregard the General Callsign; I got lucky), I could use some advice on desireable features on a new 2m HT. I have around $300 to spend, and intend to use the radio for ragchewing on the local repeaters and to try some packet activity. Of course, all the manufacturer's ads just list features and acronyms and I have no idea what it all means!

Please feel free to offer an opinion on what I might want to look for in a radio. Any specific suggestions on units in my price range would also be helpful. As an aside, comments on a reliable TNC would also be useful. I don't think I need a multimode, but is there any disadvantage to not getting one?

Thanx to all, in advance, for any info...

While stationed in West Germany, I held three DA prefixed calls two of which were based on my last name (i.e. Taggart). They were DA1TA and DA1TG. The best one however was the last one I held because of the phonetics I derived for it. The call was DA1AV. I was in the Army and had (still have) a very deep voice so the phonetics became Department of the Army's number 1 Amateur Voice. All these calls were issued by the DBP and not selected by me.

Of course I also liked HL9AA while I was the Korea Area MARS director but that's another war story.

I think though that I probably have the worst stateside call for voice at least since no one but me seems to be able to say it without either biting their tongue or ending up calling me Ray. It's K8RYA. Doesn't look that hard but try it on the air!

Bob Taggart - K8RYA

Subject: Call Signs
I got my original Novice call: WV6VVV through the lottery
What a bummer on CW. A string of Vs was the universal test signal then so no one ever came back to me. Nowdays people use "test" strung together as one letter so my call is no longer mistaken. My only regret is that I no longer have a copy of my novice QSL card. I was so relieved to get the General that I must have tossed them out. Doc, W6ZRJ, was one of my high school teachers and it was obvious that my grade would be affected

by not making General that semester. I've been in situations where my life was in danger, but it just wasn't the same as taking the General test in the S.F. FCC office at age 15.

Since the sun has such a major effect on radio propagation, I thought I'd mention that I've been reading a book on solar phenomena that might be of interest to people on this list -- THE RESTLESS SUN, by Donat G. Wentzel (1989, Smithsonian Institution Press, ISBN 0-87474-982-4, 279 pgs, no price indicated on dust jacket). I found this at the St. Louis Public Library; it should be available at many public and school libraries.

This looks to be a pretty good overview of the current thought about solar mechanics, behavior, and cycles. There is some degree of coverage of the terrestrial effects of solar activities, but the emphasis is on the the reasons behind the sun's actions. Reading this might make the solar forecasts and reports on the various DX programs and ham bulletins more understandable.

I am the Vice-President of the Delta Amateur Radio Club here in Memphis, Tennessee. We have a membership of about 250 members. We operate a 2m/220 linked repeater with a coverage of about 50-75 miles. We are hoping to put a standalone 440 repeater on the air soon.

I would like to hear from anybody who has either a 440 repeater for sale or has any comments on the various commercialy manufactured repeaters available on the market.

To Patty Winter @ Apple.Com   (I don't know how to capture previous text yet)

I got W9IP because they didn't have any of my requested callsigns left; I indicated "whatever is next" and they gave it to me. I didn't ask for my initials because I wanted to get on EME. "W9MO" would have wreaked havoc on EME because M and O are used for signal reports. As it turned out, W9IP wasn't too bad because I lived in Illinois where the electric company is Illinois Power. However, here in New York people only toggle to the obvious implication of my callsign.

Help! Advice needed!

Without going into details, in NJ any radio that operates on police frequencies is illegal in vechicles, unless you obtain a permit from your local police chief. The general belief is that such permits are impossible to get, unless you are on a local rescue squad.

Since my prime interest in radio is monitoring railroad frequencies, specifically Conrail, on a whim I wrote to my local chief, politely asking for such a permit. To my shock, he returned a letter saying YES, provided I gave him:

1. my reason for asking to listen to these frequencies. (no problem).

2. "provided you present me with proof that Conrail has no objection to you monitoring them".

This brings many questions to mind:

1. Will Conrail provide me with such proof?

2. How should such a request be worded/phrased to eliminate a negative reply?

3. Is "proof" the fact that under the ECPA and Communications Act of 1934, Conrail hasn't any business objecting ANYWAY?

Any ideas??? Thanks very much,

Lou Judice

In article <41307@apple.Apple.COM> winter@apple.com (Patty Winter) writes:
>Does this mean that 4W or 7O is going away? Gee, and we're probably
>going to lose one German prefix, too. We've got to put a stop to
>all this global gemutlichkeit before we wind up with only two or
>three countries on the DXCC list. :-) :-)

As far as telephone "country" codes go, there is not necessarily a one-to-one correspondence between country codes and actual political "countries". You quoted one example of a country with more than one code. The reverse situation also exists, right here in North America -- the US, Canada, Mexico City, and several Caribbean islands all share telephone country code "1".

Radio prefixes may also change as a result of all the unifications going on. But what *I* really want to know is what will happen to representation in the UN after 1992. As far as I'm concerned, after 1992 the entire European Community ought to get only ONE vote in the UN. Or, if they don't like that, we'll give them the alternative of allowing the US *50* votes. After all, Western Europe shouldn't be allowed to have its cake and eat it too.

Can you imagine how different the UN sponsored bodies like the ITU and CCITT would be if this were to happen? We might actually get some reasonable spectrum allocations and telecommunications standards for once. :-)

Phil

My favorite ham/license plate/policeman story of all time comes from a high school ham buddy of mine. Some years ago he worked for the Baltimore FCC field office. He had a "company car" sitting in his driveway when I dropped by his place, and I asked to poke around inside. It was a nondescript sedan from which the right front seat had been removed and replaced by a rack of equipment. It contained general coverage HF/VHF/UHF receivers, direction finding equipment, TV demodulators, you name it. Obviously they used it for undercover field enforcement. This was before I bought my R-7000, so the chance to play with a station (mobile, no less) that tuned from DC to daylight was still a novelty to me.

Anyway, as I was twiddling the knobs on the gear I casually asked my friend if the car had US Government plates or ordinary state plates (I hadn't noticed). He replied "Um, I'm not sure. I think state plates." Me: "What do you mean, you're not sure?" "Well, there's a story here I think you'll enjoy."

My friend went on to explain that the car came equipped with a stack of license plates from about 20 states. They would swap them occasionally during an investigation to keep people from getting suspicious (as though a car with a large rack of electronics where the right front seat should be wouldn't be suspicious enough.) Well, it seems that my friend often commuted to work in this car. One day, the state trooper who lived in the next block pulled him over:

"Sir, have you been in Maryland longer than 30 days?"
"Yessir." (My friend has lived in Maryland all his life.)
"Well, sir, if you're going to be in Maryland longer than 30 days, you can't have West Virginia plates on your vehicle."
"OK, no problem. I'll fix it right now"

My friend then gets out of the car, opens the trunk, pulls out a large stack of license plates, pulls out the Pennsylvania plate, and grabs a screwdriver. As he begins to swap the plates, the cop interrupts him.

"Uh, sir, if you're going to be in Maryland, then you need MARYLAND plates!!"
"Oh, why didn't you say so!"

My friend returns to the trunk, pulls out the Maryland set, and returns to work.

"Uh, sir, do you have REGISTRATIONS for all these plates?"
"Sure." My friend pulls out a thick wallet containing 20 fanfolded vehicle registrations, one for each plate. Each is registered to "US GOVERNMENT".
"Uh, sir, JUST WHO ARE YOU ANYWAY?"

My friend finally had to play his hand. He pulled out his FCC identification.

"Sir, if you had only shown that to me at the beginning we could have saved us both a lot of time..."

Thanks a million to Erik Sorgatz for his out-of-band RX mod for the FT736. This is the first mod I have ever heard of for this rig. I guess its complexity is not conducive to tinkering...

One small correction, though: there is indeed a 220 MHz module for the '736. I have one, and it works fine. Got it from the dealer when I bought the rig.

Now, if someone could just find a way to get the '736 to scan with the squelch open, then we'd be making some progress.

Other suggested mods, if anyone feels up to the challenge:
  1. A=B VFO jumping

2. Set-and-forget RIT (RIT stays on while you tune around, for EME)
3. 25 watts out on 6 meters (to adequately drive a 3CX800)
4. Tunable memories

Thanks again to Mr. Sorgatz!

M.R.O.

I spoke with the original poster of the mod to the net (you know the one that includes step-by-step doxs). He said the mod does kill data entry in the 30-54 range BUT freqs already entered will still scan and receive. So it looks like a small momentary contact switch will do the trick. I havent gotten chance to try it yet as ive been busy with other things.

    Well ive finally replaced my old DX-160 with a Sangean 803A. Im very
  happy with the Sangean but im still not ready to retire my 160. So if
  you know of any mods for this old timer please mail them to me.

  Thanx in advance.

Maybe California should emulate Texas and identify the license plates as "radio operator" right on the plates themselves. This eliminates the problem of the cop cadets who sleep through license plate identification class.

Over on the SWL group, a person posted a request for the trick of getting the back off a Sony ICF-2002/7600D radio.

I distinctly recall reading a network posting many moons ago (maybe 2 years? maybe mere?) on the ham group/list (before the SWL list existed) where the trick of dissassembling the 2002/7600D was described. I also remember carefully saving the info because I have a 7600D and might need the data sometime. Now I cannot locate it!

AAAAARRGHH!

One of those days... :-)

If the person who posted that info is still around, could you mail me the instructions, or post them? Or if anyone else out there saved the info and is better organized than I and can find it, please send me a copy. Thanks much!

Regards, Will

I bought a Sony receiver (7600DS) I like it a lot, except for the fact
that you need a converter to be able to use stereo headphones with it.
I have a question which may be dumb. Is there a way to get above the
limit of 29.999MHZ. I'd really like to listen to all those exciting
stations a lot of people are describing here. Thanks.

I always liked the idea of going to countries and trying to get 'nice'
calls. 5Z4GT and 6V6GT would have been my favourites to try for.....

(for the neophytes amongst you, a 5Z4GT is a rectifier tube, and a 6V6GT is a power beam-tetrode......)

In article <4a913ecf.20b6d@apollo.HP.COM>, hays@apollo.HP.COM (John Hays) writes:
> I am waiting for the poor soul who gets NH5HHH   :)

A few years ago when I was in the Rio Grande Valley I heard the "CW call from hell" on one of the two meter repeaters: WS5H. Getting a call like this is one of the reasons I never opted to enter the FCC Random 2x1 Callsign Sweepstakes.

In retrospect, the likelyhood of getting a *really* bad call was quite small. I just didn't understand how to play the game. Not too many calls are ever issued in a given day (or week) for a particular call area. If you pick a prefix you like (such as KM5, or whatever), you could get it with proper timing. Personally, I would avoid the letters in the beginning of the alphabet (dit-intensive letters like H and I and B don't tickle me). Given such, I could pretty much accept anything in the M-Z range, although I'm not crazy about S and V. So be it.

Call the FCC and ask what the "next" callsign is in your block. Once they get up to the right spot (say KM5M), then Fed-Ex your 610 to Gettysburg. Unfortunately, the were in the AA5xx calls by the time I got comfortable with this idea and I am having trouble getting excited by the thought of becoming a yay-yay-five. Sigh.

Maybe another PRB-3 or whatever will come along someday.

An interesting report, Erik. But are you describing the ft736 or the ft726
or what? My ft736 covers 430-450 with one module, and I am sure the 220
module is available. The ft736 comes with 2m & 70cm; you can add 2 more
band units, choosing from 6m, 220Mhz, and 1.2GHz.

This reminds me of a conversation I had with K1MM and K1MEM at Dayton one year. Since they are both avid DXers, I asked if this didn't cause some confusion in the pileups. Jim (MEM) joked that it was actually a windfall for him, because he never had to send his whole call, just a properly timed dit.

I have not seen any one else post this, but I am sure by the time you see this, someone else might, but JUST IN CASE:

Page 23 of the latest BOB GROVE mailing says:

The Realistic Pro-2006

The most popular high performance scanner ever is even better

COMING SOON!

Well leave it to old Bob G to know more than the boys at the local RS (Radio Slouch) store!

What does it LOOK LIKE? Gosh, I said to myself. Looks exactly like my 2005. Well sure enough, Bob (Master of Hype, creator of the soon to be delivered SR-1000 with the FAKE mock up picture in every catalogue [I have DONE fake MOCKUPS I know what to look for, can you say VAPORWARE, I KNEW YOU COULD]) the picture in the 2006 ad is really a 2005. The photo is underexposed to make the scanner at first glance seem new because it is not the light grey, but a much darker hue.

RAPID 26 channels per second search. He does not mention the metal case.

Correct me if I am wrong, but can't you just clip a diode to get this feature?

NOW HERE is where I have the WB8EOH Theory of the RS SCANNER DIODES CONSPIRACY. Read closely folks, I think I am on to something.

Let us suppose that you were a marketing genius. Let us say, you wanted to OWN the scanner market for the next 5 years. What would YOU do. Now if I were in that position, here would be my plan (Let us assume that I am also greedy, and slightly devious)

I would have my people in Japan design a scanner so advanced it would blow everything else on the market out of the water ten times over.

Then I would order a billion circuit boards, but in the design I would do this.

I would set it up so that instead of selling this remarkable scanner outright, I would add DIODES to it that would CUT BACK on the performance.

One diode to CUT BACK the number of channels from the 400 that was designed into it, back to 300. One diode to SLOW DOWN the scanning rate. One diode to DELETE a band of frequencies, and so on.

So I would release the FIRST version of the scanner, and everyone would say: WOW a 300 channel scanner, wow!

I would sell that scanner for a couple years, then I would retool the case, but keep the same circuit. ONLY I would instruct the people doing the wiring to omit the diode that keeps it a 300 channel scanner, so I could sell my NEW 400 CHANNEL SCANNER!!!!

I would sell that one for a year, and then I would blow it out at a cut price, and introduce my NEXT version of the circuit board, and instruct my guys to LEAVE OUT the diode that cuts the scan rate down, so I could say "NOW A REMARKABLE 26 channels a SECOND"

Now if the WB8EOH theory holds, here is what happens next:

I would sell this new scanner for a year or two, waiting for a test case of ECPA, which will certainly get that silly law repealed, and then instruct my boys to build them without that last diode. Then I would blow out the 2006 at a rediculous low price and tell Bob Grove he could be the first to print:

THE BEST IS EVEN BETTER!!!!! NEW PRO 2007 NOW INCLUDES CELULAR!!!!!

The only fly in the ointment would be if some scanner underground had the original 300 channel pro 2003's and found out that by clipping the diodes themselves they could upgrade their OLD scanner to the one I would be selling in FIVE years, and they would not spend the $419 on the SAME scanner every one or two years.

That's what I would do if I were a savvy marketing expert wanting to corner the entire scanner market for myself.....

Sounds like science fiction huh. I shoulda cross posted to alt.conspiracy.

I would like to make a few mods to a Uniden Hr-2600 10m all mode radio mainly in connection with is use as an IF for transverters to 144 MHz and the higher bands. I would like to reduce the output power to a sub 100mW level to save having to use a high power attenuator and to conserve battery power (/P operation). It would also be nice to change the 5kHz scanning step size to 1kHz and to extend the frequency coverage to 28-30 MHz. Before I go digging into the radio with a soldering iron, has anyone done these mods or can anyone direct me to a source of such information?

```

Can someone out there tell what the composition of an EBS alert tone is?
I am considering building an AM receiver with an EBS tone decoder on it
for use during severe weather emergencies. Our local EBS primary station
transmits the tone with severe weather alerts.

Thanks in advance. By the way, if you know of a cheap (under $50) unit
that does this, let me know as well.

One thing that has always eluded my old monitoring ears has been REAL
communications satellites. The good stuff like FLTSATCOM, etc. I have
talked to people who have heard such things on their REAL communications
receivers (R-7000, etc), but nothing here has ever showed up.

Yeah, I know, Sow's Ear != Silk Purse   The 2005 is a nifty highly advanced scanner, but does not have fine tuning capabilities, etc. And it is not overly sensitive compared to an ICOM R-7000. It does what it does very well.

I have heard some of the WHEEDLE WHEEDLE sats, but I want to hear voice coms. One guy I was talking to on 20m once told me about hearing satellite relays of riverboat traffic.

Now I do have a fairly good antenna (CHANNELMASTER 5094) BUT it does not have any gain in the region (200mhz-300mhz) where I have heard some of these birds live.

I am wondering if someone out there in netland has bagged a real voice com sat on the 2005, and if so using what antenna, and what freq, and what quality signal.

This sounds like a nifty hobby, satlistening, but before I go drop a bundle of bucks on an R-7000, I would like to know what is there, and if I can at least get a hint with the 2005.

```
I will understand if the answer is:  GET A REAL RADIO, KID...
                                            ~~~~

I've had an interesting ambiguity problem of late, too. W6ZH is
also an active DXer (Pete Hoover) and he and I have been in the
pileups together a few times.

And now KI6ZH has burst on the DX scene, and he's also in San
Diego. The three of us get a few of each other's QSLs, especially
thru the buro. But we've all had a problem with trying to
convince some DX stations that it was the OTHER 6ZH who was in the
log a few minutes ago!

Does anyone out there hapen to know what a 'damped wave' or 'B wave' is?
They're mentioned in the FCC rules, Title 47, part 97 (that's us, boys!)
and are _strictly_prohibited_. Is this some old spark-gap stuff, or is
it a vague reference to 'Berthold Rays' from Star Trek? Inquiring minds
gots'ta know....See ya on DaveTV (427.25, 439.25)

Robert Casey (rfc@briar.Philips.com (Robert Casey)) mentions commercial radio call sign "NERD" and wondered if there were a "N3RD". How about a new "B" prefix? It would be great for one of our private pilots... it could be "B1RD".

I suspect that what you heard was an image frequency. Most news media (on the UHF band) is situated from 450 to 451 MHz. Try looking up the IF (intermediate frequency) of the UHF receiver portion of your scanner, multiply by 2 and add it to 407.750. See if the real channel is not 450.xxx. In order to obtain the wide tuning ranges, most scanners do not have tuned "front ends", thus are susceptible to images; a frustrating, but common, problem.

>I do now know much about Ham-Radio and I just want to know how I can communicate with my friend in korea thru ham-radio.
>Is the novice license enough for me to talk to me friend in Korea?
>Do I need to buy a very good radio since Korea is so far from USA?

Dong Hwan Kim:

It is absolutely possible to communicate with your friends in Korea using ham radio. It will not be completely reliable, and you will have to choose your time of day carefully, but you can probably have good communications with Korea several times a week. You raise several points, which I'll answer in turn:

a. A novice license is absolutely adequate, but you will have to do your communications using the international morse code. A novice license will allow you to communicate in the band 7.100 MHz - 7.150 MHz (among others), and it is on the 7 MHz band that I hear the Koreans most frequently. It is almost always possible to hear Korea from California just about sunrise each morning. You have to search hard to find them, because there are many Japanese stations active on 7 MHz at that time of day, and some of them are quite strong. But the Koreans are in there! A novice license will also allow you to transmit using voice in the range of 28.300 MHz - 28.5 MHz, but long-distance communications in that frequency range is highly unpredictable. It is only good during the daytime, and there needs to be a high level of ionization in the upper atmosphere in order for the signals to refract back to earth rather than escape into space.

b. You will not need a particularly expensive radio to reach Korea. You should expect to pay maybe $1000, somewhat less used. What will be more important than the radio will be the antenna you use. It will probably be a wire stretched horizontally (roughly 66' long, and it needs to be up as high as you can get it, and in no case less than about 45' from the ground), or a vertical aluminum tube about 33' long. Either can be made from inexpensive materials from a local hardware store.

Good luck!

I've been using the GMS-403 Nicad battery charger from Control Products Unlimited 215-383-6395 to charge ALL of my nicad batteries.   I have program modules to charge my lap-top computer battery, electric screwdriver, radio batteries, ... ect...   I have been able to recover several packs that had developed 'memory' and I thought were lost by using the chargers memory erase feature.   The 470 pack is charged in about an hour, typically.   Give CPU a call and request a brochure.

Ah, dem numbers how I loves 'em. In fact, I have only
heard a few. But then, I haven't been on the air long enough in the
past years -- my wife yupped out on me and I had to take the station
out of the living room -- so if them number stations is still around,
I'm not surprised.
But, judging from what I've heard and read, I firmly believe that
they are conspiracy con to try and dupe the true believers in the
One Trualesman into thinkng that there really is a con from somehwere
else! Gawlee, do I love that.
Those sullen sobs out there with their AR17 and AK47 -- most of 'em in
the oil soaked hills of Montana (Hi, Liz. How's the Crutch United and
Flatulent?) are dead serios. They want you to be dead serious too. Most
of all they want you dead. So, do, indeed, be careful around 'em.
Which makes me wonder if they might not have something to do with Olie
the Colonel and his gang of badgers. How many hostages have the numbers
stations caused? Will we ever know? Given the climate of the media, will
we ever want to know?
Only "Bob" Dobbs knows for sure, and he ain't talking.

This is NOT meant to flame Steve. I greatly appreciate the efforts of QSL managers. However, some would appear to make more than a 'little' at it. These people tend to tick me off a bit. I recently had the ocassion to work some stations who have OH2BN for a QSL manager (he seems to be a popular manager). As usual, I sent my card with a green stamp for each contact as they were worked at different times. I have received one card back. Guess what? It was mailed from California with a 25-cent stamp. Say he handles QSLs for a dxpedition and gets 1,000 cards from U.S. hams with a green stamp. He spends $250.00 for stamps and keeps $750.00. This is more than a making a little money. I have had this happen a very few times over the past 13 years. Most QSL managers do not do this.

If QSLs are to be mailed back from the U.S., the QSL information should include the fact that an sase should be sent with the card. I have no problem with honesty, but do have a problem with deception! It is good that this type of QSL managing is the exception to the rule.

Most QSL managers deserve a large pat on the back for their efforts. Without them DXing would not be very worthwhile.

The atomic clocks are in Boulder, 499 prefix, the antenna farm is on the north end of Fort Collins. I grew up in northern Indiana and would listen to WWV on my dad's shortwave radio. At that time I never dreamed I would some day live out here in Fort Collins. Or maybe I did dream it...

Out here WWV comes in great on shortwave, pretty well on cheap AM radios, and not to badly on a toaster. :-)

I heard a similar story recently at a talk given by an FCC employee who used to do location work. In his case, he was waved over by a NY state (I think it was) inspection unit that checks the validity of safety inspection stickers. The trouble was that the "company car" was wearing NY plates but they had forgotten to put the inspection sticker on the windshield. (Apparently they are stocked with the appropriate stickers as well as license plates.) The fellow looked in the glove box--no stickers left. So, while he was waiting in the line of cars at the inspection point, he casually got out of the car, went to the back, opened the trunk and changed to another state's plate. When he got to the front of the line, the cop looked at his plate, shook his head in disgust and waved him on!

Found the following description of the operation of an amplified FM broadcast antenna: "It hunts the airwaves for hidden and weak signals and pulls them in like a radio magnet."
"Once it locks on to a signal, a Gallium Arsenide Field Effect Transistor

(GaAsFET) inside the antenna traps noise and static-hiss and literally obliterates it."

Kind of a strange way to describe a pre-amp. Wouldn't think that a pre-amp would "trap" noise!

Was thinking back when (summer of 76) I took my Tech test at the FCC office in NYC. If I remember correctly, the code test was easy, and I probably got most all of it correct. I did worse on the theory and rules part. Almost failed it, the FCC person said I got the minimun +1 correct. Maybe the person who assigned the calls saw the test results, and figured I'd be a CW fan, and gave me WA2ISE .. ... . from what they had on the list that week?
Turns out that I don't like code much!

In article <3342@radio.oakhill.UUCP>, charlie@oakhill.UUCP (Charlie Thompson) writes:

> I'd guess Bob Parnass might know the answer to this ....
> Much to my surprise I found a local AM radio station (KLBJ-AM) using
> 407.750 MHz as studio-to-remote director's link.

I've never visited Texas, but in northern Illinois, this is what folks hear on that frequency:

```
 407.7500    call?_____US: Postal Svc, DVP scrambling, f3, input to 415.050
                       [Chicago] (others)
```

Two years ago, I found a similar signal on my R-7000 and BC-300.

A remote broadcast link transmitter was wandering several megahertz up through the 462 MHz GMRS range and beyond. I traced it to a spur in the WSPY remote transmitter being used to broadcast the local high school football game. I called the station and argued with the non-technical guy at the studio for 30 minutes.

[The only way I convinced him it was his equipment problem and get him off the phone was to tell him
   1) I work at Bell Labs (big deal, eh?)
   2) My pizza was getting cold.]

He finally admitted that the remote transmitter had a history of these problems and they never used a spectrum analyzer to check the spectral purity of the signal. The remote's signal sounded fine on its assigned fundamental frequency, but the phantom spur had muddy modulation and wandered around the UHF spectrum like it had a mind of its own.

During the STS-35 SAREX mission, AMSAT will provide a network to link
US classrooms through local repeaters to a amateur ground station
in contact with ham astronaut Ron Parise.

WA3NAN at Goddard Space Flight Center hopes to retransmit the SAREX
communications - interrupting the NASCOM shuttle communications
retransmission for the duration of the SAREX communications.
However this will require that a phone patch operate at our station with a
kilowatt of power on four different HF bands. Installation and testing
are in progress.

Some of you OTs out there... please explain this! I've been licensed for over a year now, and I have heard about "the way it used to be" a few times, but was never told exactly how it used to be! And it was recently mentioned again (by a WB6...) about the callsign "change".

I understand that you used to be able to pick your own. Is this true? One of our more notable hams in town, Tom Comstock, has N5TC.

Please explain, OT's... How did it USED to be?

I was poking around through the ARRL Handbook the other day and came across this info:

86 Handbook, page 36-3,
  Guy Mitchell, WD0DVX passed the code test at age 4 and passed
  the written novice test at age 5 with the above resulting call.
  There is a picture of him also, but I think the picture was taken
  when he was a couple of years older. No date was given when
  all this took place.

I am not sure this is the situation that was referred to earlier, but it is mighty close. Granted, the novice test is trivial, but I still don't see how a 5 year old could have understood the concepts behind the questions. It must have been memorized without meaning.

Waaay back in the ooolllddd days (pass me the Geritol, wouldja?), say around 1972-1973, the FCC experienced a momentary, fleeting spasm of good-natured-ness and let Extras request a 1X2 callsign. You had to pay a modest fee, but it was well worth it. If they didn't have the callsign you asked for, you could request "next available," as I did. This system was the way that most of today's 1Xmy initials came from. Needless to say, it's too bad that the spasm didn't last.

Hi All!

Well, I thought I had cleared the biggest obstacle to becoming a ham when I passed the code and theory and got credit for my Technician class license (I passed the theory for General and plan to take the 13wpm next month). However, I now find out that I cannot mount an antenna on the tallest point on the house. My Dad thinks that if a strong wind blows, the whole house will fall down (or something like that!). Anyway, I can put up an antenna on the side of the garage. The only problem is, we live at the bottom of a small valley. If the antenna was mounted on the side of the house, a signal that radiated 20 degrees from the horizontal would just about clear the surrounding terrain.

My question is this, is it worth it to mount the antenna on the garage, some ten to fifteen feet lower? Or should I just forget trying to work the HF bands for the time being and buy a 2m HT instead and drive to a higher place?

Thanks in advance,
Andy Greenshields [dxandy@widener.BITNET]

Has anyone had an affiliation with the MARS net? What is required to be
a member? May non-military hams participate? If so, what is the procedure/paperwork routine?

Thanks,

I, too am interested in becoming a ham and using a computer for code practice. I would appreciate any information on Public Domain (commercial is O.K. too) software written for the IBM for purposes of code practice. Suggestions are welcome. Thanks :-)

Is there a place where I can purchase or get an audio tape containing valid WEFAX signals? I have written a program, but need to test it on a known good signal and am having severe trouble making sure I have a valid station tuned in and all is ok. I can live with some distortion in the playback, but would like to at least make sure I am doing a reasonable job of decoding the signal. If there is a kind soul out there that could record a couple of WEFAX signals while simultaneously making a WEFAX picture to send me, I would be forever in their debt. With a tape and a picture, I can figure out how to reproduce the picture from the tape and will KNOW what I should get. If there is a shortwaver or Ham in the Santa Clara Valley of Ca that wouldn't mind just doing the recording, I'd like to try that as well. I can live without the picture, but it would be nice to have both the tape and the picture.

I did manage to get one decent copy of a WEFAX signal that is very recognizable, but have changed the software since then and am not able to get a decent picture. I don't know if it is the software or if I just don't have a good signal.

Sure it is worthwhile! Don't forsake the low bands just because of a less than ideal location. You will; be surprised at all the DX you work with a modest setup.

Set up whatever you can manage and have fun!

At the risk of redundancy...

In the Very Early years (up to the early 20s?), calls took the form 1AW, 2YZ, etc. National prefices came into being in the 20s. (The US was NU for a year and then W and K when they redid the scheme.) The FCC gave domestic hams W#xxx calls after the 2-letter suffixes ran out. The K series was used for territories (K6 for Hawaii, etc.).

After the war, the FCC gave Kx# to territories and when Novices were introduced, they got WN#xxx, with the N dropped on upgrade. The W's ran out so K#xxx followed. Then around 1958 WA's began, with WV for novices (in 2, 4 and 6 only, I think); WB's had corresonding WNs. I had a WN2 call in 1965 that would have become WB2 had I stapled the novice to my tech application. (Instead I got a different WB2). The WB2Z series ran out by 1967 so they started reissuing vacant WA and WBs. For a short time in the 1970s WDs were issued in a few districts. (WC was the novice variant of KC, which was the Caroline Islands/TTPI.)

In the late '60s, Extras could request (for $20) a random 2-letter call. In the early '70s, fees were abolished. (Long story omitted.) In the mid '70s, Extras could request a pick of calls (send list of choices); if you were an Extra prior to such-and-such date, you went before those in a later class. I got my Extra in '76 in order to get in the line; fortunately, my first choice (K1IO) was still vacant by 1977 when my turn came up.

Then in '78 or so they adopted the current horrorshow and stopped allowing any choice. They more recently turned down a proposal to allow the ARRL (or another outsider) to administer a u-pick-em program.

Is it necessary to send QSL cards to QSL managers in order to get a card from the station worked? Is a simple note to the manager with the usual band, mode, date & time (and SASE or SAE and IRC) good enough?

Do the stations worked ever get these cards? Do they even want them? If not, then we can save money by not sending cards. If we work a station on several modes and or bands, do we have to send a card for each? Again we can save money by sending a list with the info and not the cards.

If the operator worked really does want my card, then I have no problem sending mine, of course, but if the manager tips them, then it's a waste. With even simple cards costing 15 - 20 cents each, quite a cost saving can be had by using a list.

Any QSL managers out there want to comment?

I know of a four-year old who can read a great deal of the newspaper. Granted, he has trouble with words like Vladivostok, but he groks gross national product and Hawaiian volcanoes. A regular chip off the old block too -- his dad and he were in front of the TV one day when one of the local yokels was making his pitch for Georgia governor. Daddy said [after Mr. Roger's style] "Can you say 'sound bite'?". From then on, the kid sees a political ad, he says "sound bite." Funny thing, the wisdom of children often surprises us all: now, when he sees a TV lawyer who want to help us with "debt relief and settlement protection" and he says "sound bite." :-) :-)

I know very well one individual who could read (granted, with little comprehension) at 1 1/2, pronouncing all the "regular" words very well. He __doesn't remember__ learning to read and, for all he knew, kids were born with things like the Star Spangled Banner and the 23rd Psalm already memorized. His theory is that his grandfather unwittingly taught him to read sitting on pappy's knee while the old man read out loud to himself, pointing at the words and spelling out the letters of words over six characters in length [some times an 8th grade education can accomplish more than that of a Ph. D.].

A three-year old is learning at a rate an order of magnitude or better above a 10-year old. Some don't wait 'til later to get into the meatier stuff.

From the price list 9/87:

"TEC-200" is a trademark of the Meadowlake Corp.

25 Blanchard Drive,
Northport, NY 11768
USA
(516) 757-3385

I've used it but I have no other connection with 'em.

I've used Tec-200 but I'm not certain that it is different from copier transparancies since I haven't ever tried the same trick with them. It definitely handles high temperatures better than some materials. As far as I can tell, the magic is that it doesn't distort too badly when you heat it to 275 degrees or so to get the toner on it to come off and stick to the PC board. Even Meadowlake, the manufacturer, recommends that you trim the material back to just slightly larger than the actual board you are trying to make.

I've made a number of boards with varying degrees of success. Success seems to have a lot to do with how much toner your particular photocopier can deliver to the film. I've usually ended up going over the transferred toner with an indellible marker to "fill in" the pin holes.

My next attempt at prototype boards is going to be generate photowork directly using transparancy film and a laser printer. I think I will bypass the idea of plotting directly to a board with an X-Y plotter due to experiences with using hpgl output and difficulty of getting good area fills.

If anyone else has found successful tricks for moderate complexity two-layer no-plated via boards I would like to hear about them.

Yes, you can just send a list on a piece of paper (or a single card
with multiple qso information on it) but there are certain risks
involved. For one thing, this complicates life for the qsl manager
so there is a good chance that your request will relegated to the
bottom of the processing stack. Furthermore, suppose that you work
a station on 5 bands/modes and send one letter. Suppose the manager
finds 4 of the qsos in the log, but can't find the 5th immdiately.
Then (since you presumably sent 1 sase) he will hold up the 4 good
cards until he gets a chance to investigate the 5th. For a busy
DXpedition, this could mean a 6 month to 1 year delay in getting
your cards.

>can be had by using a list.

Since when do cards cost 20 cents? You can buy 1000 cards for under

$50. Remember that the qsl manager is a volunteer; you should do everything possible to ease his burden and speed his processing. Also remember that YOU are the one who wants the DX stations card. The DX station is really under no obligation whatsoever to QSL.

I think in general most qsl managers do a fantastic job for no rewards. We should do what we can to lighten their load.

My dad's call was W2UM, when I used it for cw contests it
usually came out as :
W22   .-- ..--- ..- --

and mine at the time was WA2JAM which often was heard as
WA2JJ   .-- .- ..--- .--- .- --

then I had VE2AXW in Canada for a while, that one was a
bugger on phone as well as cw. I gave up the fight and
and requested my current call

K3FR   -.- ...-- ..-. .-.
"KING THREE FRIED RICE"

That one got a lot of chuckles and tickled K7FR enough
that he picked up the phonetics for his own call.

[are there really any line eaters out there?...]

In a recent posting, Jim K6ZH <price@marlin.UUCP> says...

>Next there were WA6xxx calls, again issued until they ran
>out which in Calif. was 1962.
>And then there were WB6xxx calls, most of which were
>issued by the early 70s.

While it may be true that the WA and WB calls were all used up in
6-land, they were not in many (most?) other call sign districts

(like 1-land). I remember reading ham rags in the 70's where the FCC realized they were running out of WA and WB calls, didn't want to keep going on with WE, WF, WG, etc., and had decided to reissue old WA and WB calls. My impression is that the class-specific call sign scheme we have today did *not* result from running out of a particular call sign format, but rather from the desire to have the license class recognizable from the call sign format (makes policing much easier!).

>And for a brief time the FCC issued WD6xxx calls, but only
>get about 1/3 into the alphabet. No WC calls were issued.

WC calls were issued exclusively to CAP (and maybe MARS, too?) stations.

>Meanwhile, incentive licensing was being implemented
>which brought with it distinctive calls for each class of license,

Incentive licensing was entrenched well before the recent class-specific call sign mania. I've heard that at one time there were only two classes of licenses, "A" and "B", I think. The Novice license seems to be the real beginnings of incentive licensing: make entry into amateur radio quite easy but provide very limited privileges and use the privileges of the "full" licenses as incentive to learn more technically. The full incentive licensing program, established in the late 50's or early 60's, established the present five license classes that tied more privileges to demonstration of more knowledge and skills.

To the comments already posted, I will add...

Prior to the distinctive call signs scheme used now, there were some other noteworthy call sign schemes:

- Novices were issued calls like KN1ABC which were changed to K1ABC when they upgraded. Later they were issued WN1ABC calls which were changed to WA1ABC, WB1ABC, etc. when they upgraded. The point here is that they got to keep their three-letter suffix.

- I think at one time Technicians were issued K1xxx calls at the same time Generals and Advanceds were issued WA1xxx. This would have been in the early to mid 70's. Can someone confirm or deny this?

>
> I hate to pick nits, but shouldn't the above read "If there is 1 bit/symbol,
> then the bit rate and the baud rate are the same number."

One of the problems I have often had in grasping new concepts is the poor choice of terminology. This is one of those cases. When I was originally learning this about bit rate and baud rate, the term "symbols" resulted in a lot of confusion because I had a different understanding of the term. In actuality, both this usage, and the understanding I had were correct; the term has a very broad usage. The problem is that even if I did know the full meaning of "symbols" then I would not have known what was meant anyway.

Symbols are a member of a set of values. Characters are symbols. However in the usage as it relates to baud rate, it really is referring to the modulation symbols, or more specifically, the values the modulation can have. If the modulation can emit 20 different values in one second then the baud rate is 20. At each of those 20 positions in time (or space) the number number of different values that could appears might be very large or very small, but this does not affect the baud rate.

Bit rate refers to the number of data bits that can be encoded in some sequence of these value symbols. Usually the "encoding" is very simple as in FSK where there are only 2 values (space and mark or 0 and 1) to choose from. Only 1 bit can be encoded for each value, so this is the case where the number of data bits equals the number of values in a given time period and the baud rate equals the bit rate.

If there were 16 different data values to choose from at some point in time, then you could encode 4 data bits in that one value. In this case, the bit rate will be 4 times the baud rate. If you transmitted 1200 of these data values each second, you would be able to transmit 4 bit for each one, or a total of 4800 bits per second.

When a single value can be chosen from a set of 2 possibilities, we can easily think of this in terms of understanding the 0/1 or off/on state of digital circuits. If there are more than 2 values, then it becomes more difficult. One possibility is to have 16 different voltage levels with a circuit that can detect which is it. Noise immunity would be less because it would only take much less voltage as before to fool the circuit. Yet another, and more common, way to encode multiple values is to deal with a sinusoidal carrier in the complex plane. Imagine an array of 4x4 dots. Assign a number from 0 to 15 to each one. Now put a 17th dot in the center. The center dot refers to the carrier being turned off. A line from the center to any dot is the vector value. The length of the line is the amplitude of the carrier at that time and the angle of the line is the phase angle of the carrier.

>

Yes! The stations usually end up getting the cards, even though there may be a couple years of delay in the process. I was operating KC4AAA at South Pole last year 13 months and had a QSL manager back in the states handling everything for me. When I returned from my trip in December, there was a box of 2,000+ cards that had been answered awaiting whatever plans I have for them.

Will these cards ever be used? Yes, I'm SLOWLY going through them for my DXCC and whatever other awards that would match the decor or my room. Now, however, I'm just trying to separate them into three piles, USA, JAPAN, and real DX; and the cards keep coming! The U.S. ones will probably get used for a WAS award. But realistically I'll have many more U.S. cards than I'll know what to do with.

So, if you're a U.S. ham working a D.X. station, chances are he won't NEED your card, and a note with the contact info will suffice. BTW,the note will even count as a "QSL" should the D.X. station wish to submit it for an award. But he can also look you up later should he want a real card. All cards are appreciated, USA included(!). And in my case, all cards are being read.

Please explain, OT's... How did it USED to be?

Mark C. Lowe - KB5III

MCL9337@TAMVENUS.BITNET

It used to be that Extra class hams could choose their own call. This only lasted a few years (like 3 or 4) and was phased in gradually, with the old-timers getting first choice. I was fortunate enough to have the Extra during the time this was in effect.

Also it used to be that ANYBODY could request a previously-held callsign to be reassigned to them. I remember when they started issuing non-WN callsigns to Novices, one fellow requested his old WN call back (since it was now not officially a Novice callsign.) He got a lot of flack when he used it on the 2M repeaters.

Posting on behalf of Mr.Cadet Rick Yoder

Subject: Shortwave/Teletype Reception

I recently bought the Teletype conversion program for shortwave bands (up to 26100 kHz) from Software Systems Consulting. My reception problem stems from the fact I can't have my radio (a Siemens RK651) more than 3 feet from my computer. I've grounded both and it doesn't seem to help much. I have an antenna that runs out my window and up to the roof.

It's a typical shortwave listeners setup, and I'd really like some advice on some how shielding the radio from the computer's emissions, or inducing them down another path than my radio. Also, does anyone from the NorthEast have any verified teletype freqs? I live about 52 miles north of New York City. If something doesn't improve, I just waisted money on this software.

Please mail replies to x13689e2@usma3.usma3.edu

Thanks in Advance,

Cadet Rick Yoder

What about the poor soul who gets KO0OO? :-) (For computer displays that don't distinguish betweens Zeros and Ohs, thats Kilo Oscar Zero Oscar Oscar.) Should be a legit Advanced call, no? Will probably take ages for the Novice calls to get to KO0OOO, though. Hopefully, by that time, a no-code licensee will get that call :-) :-).

I missed KK6CQ by 25 calls, KK6CW by 19 calls, KK6DX by 8 calls, and AA6TX by one bloody call. Time to move to another state and enter the lottery again :-).

Many thanks to all the hams that responded to my "useta be" request on the callsigns! It's made for some lively reading here, lately.

I really enjoy hearing about the way ham radio was in the past. There really have been so many changes, and we should never forget where we came from!

It is a pity that there is less homebrew nowadays, what with the complexity of the radio world. But there are still challenges in ham radio, and all you guys (and ladies) make it all so worth it!

I had my first CW QSO since about a year ago on 40m tonight with Dube Todd. It was great to get back on HF again after so long.

This is one of the greatest hobbies there is. I try to get ALL my friends involved, at the risk of making them tired of hearing it, but what the hey!? We won't get any new hams by not talking about it, will we?

We should have an INFO-HAMS net sometime. Nothing political now!!

Whats in a dongle? well most of the dongles i have come across make use of the
SERIAL port (COM1/2/3/4) on an IBM-PC. There appears to be a single large
IC inside the dongle i have for AutoCAD(tm).
I have a protocol analyser, so someday, i may try to see what the dongle does.
Some of the early dongles were a simple AND-gate driving an oscillator.
The software raised control-lines on the interface in a particular sequence
and the oscillator started. Output from the oscillator was routed to one of the
input pins of the RS232. A software counter/timer in the PC software looked
at the input pin for a known time, and clocked the number of transitions on the
relevant pin; looking for the 'right' oscillator frequency. If it got
the right number of counts, all was OK and the software executed.
Otherwise, the software gagged, saying 'no lock device installed'.
If you had a frequency-counter and a signal generator, you could find out the
necessary frequency, and fake the presence of the dongle. However some software
tested for the dongle at times during EXECUTION (not just at load time!) so
sometimes this approach failed.

There was a window for a while in which EXTRA CLASS license holders could turn
in a one-time preferred call list.

FCC would take your list and assign you the highest one on your list that was
not previously assigned.

This was a limited time offer back in the 70's and has not (very likely will
not ever) been repeated.

It ONLY applied to Extras.

Let me add to Mike Owens' comment. Back in the ancient days, even before 1972 (perhaps even before Geritol), there were W's and there were K's. If you were one of the Hams from the "brown-shoe" days you had a W prefix. The newcomers all got K prefixes. Novices got a (by that time) KN call (KNnXXX). You didn't get to select. You got what came up, a la today. As a novice you had one year to upgrade to General or else. On upgrade, you simply lost your "N" and your call became KnXXX. If, after a year, you didn't upgrade, you lost your privileges (your non-renewable license expired) and your call went into the dead file.

Date: 23-May-1990 10:24am HST
From: 1843EIG/EIE
           1843EIE
Dept: 1843EIG/EIE
Tel No: 656-1158

TO: Remote Addressee   (_INFO-HAMS@WSMR-SIMTEL20.ARMY.MIL)

Subject: MARS Affiliation

Dube Todd asked, so I thought I'd post this for everybody's benefit:

The Military Affiliate Radio System (MARS) is a Department of Defense sponsored program, and each military department (Army, Air Force, and Navy/Marine Corps) runs its own MARS program. You can only join one at a time.

The MARS mission is to provide Department of Defense sponsored emergency communications on a local, regional, national, and international basis as an adjunct to normal military communications. It also provides auxiliary communications for military, civil, and disaster officials during periods of emergency. The MARS program also provides morale and quasi-official record and voice communications traffic for Armed Forces and US Government personnel stationed around the world.

The requirements to become a MARS affiliate are as follows:

1. Be 14 years old or older (parental consent required under age 17).
2. Be a US citizen or resident alien.
3. Possess a valid amateur radio license (Note: Novices must upgrade within 12 months of entry into the program).
4. Possess a station capable of operating on MARS HF frequencies.
5. Be able to operate the minimum amount of time for each quarter (12 hours/quarter for Army and Air Force; 18 hours/quarter for Navy).

The benefits of MARS membership are:

1. Being part of a worldwide communications network supporting vital US interests, and contributing to the welfare and preparedness of the nation.
2. Increasing your radio skills by specialized training and participation in structured traffic nets.
3. Operating on specially-assigned military frequencies using SSB, RTTY, CW, and packet.
4. Participating in the MARS Excess/Surplus Equipment Program after six months of membership.

OK, that's the official line, now here's my pitch:

I've been in the USAF MARS program since September 1985, and have had a blast passing traffic, participating in military open houses, and other activities. Some MARS affiliates get together and operate Field Day and other contests, so your activity isn't necessarily limited to military activities. The 12 hours/quarter requirement may sound like a lot, but it works out to just 1 hour a week. With today's solid state rigs, getting on the oddball frequencies isn't a problem at all -- that's why you see "MARS capable" or similar wording in many equipment ads. The Excess Equipment program can yield some real gems and, quite frankly, some real junk; however, hunting the stuff down is half the fun! Before Novice Enhancement, MARS was a good way for Novices and Techs to get on HF SSB; it still serves the same purpose, although you'll never be able to work DX on a MARS net like you can on 10 meters.

The May and June 1990 issues of "CQ" also have information about MARS.

So you think MARS may be right for you -- here's how to get more
information and membership application forms (USAF MARS only -- I
don't have the addresses for the other services):

1. Contact the Chief of Operations of the Communications Squadron
or Group at the Air Force base nearest you, or
2. Write to: Chief, Air Force MARS
HQ AFCC/DOOCM
Scott AFB, IL 62225-6001, or
3. E-mail me at 1843EIE "AT" HICKAM-EMH.AF.MIL.

73,

Will you be on VHF? Probably 1200 baud, unless someone is doing something
unusual in your area. At HF you would run 300 baud.

>   And last, but not least, Could my current modem be used for packet at all? I

No.

I need plans for a simple He-Ne Laser power supply.
It must be 1700 V at a min of 6 mA. I have a 0-50 VDC 0-30 A bench power
supply which I wouldn't mind incorporating, I would like it to allow me
to vary the 1700 V. I have seen laser power supplies that ran off of 12
V car batteries but I have not seen the schematics for these.

Any Info is appreciated.

Lance

Andy,
I would put up the antenna on the side of the garage and have fun! You
don't say what kind of antenna you have in mind, but it should work.
There is a lady out here in net-land that lives in a mobile home park,
(read NO ANTENNAS) and she loads up the aluminum carport cover. She
has a DXCC so carport covers can't be all that bad! There are plenty of
hams living in apartments that can only string up inside dipoles or other
less than optimal antenna and get out fine. Just about any antenna you
put up will work and give you plenty of fun.
73's and hope to work you some time

First, I just got my Technician class license and call sign in the mail from the FCC. It took exactly 5 weeks and 2 days from test day.

I've been shopping around for a 2M HT. I just realized that almost all the HT's are FM and that all the repeaters are FM. But I've been listening to the 2M band on my Sony Air-8 AM scanner. Am I very confused? Or is slope detection or some other form of parasitic detection that good?

Thanks,
---

Yes, the "standardized" test can provide a barrier and perhaps does not test the individual for the proficiency/ability on the subject. But... on a open ended question, essay type of exam you are now subject to the subjective interpetation of the exam grader. This is the sort of thing that makes lawyers hyperventilate and start to look at the latest of hot sports cars. The standardized multiple choice exam on the other hand is very hard to attack because all candidates take the exam. The only

thing open for attack is the cutural type bias that may exist in the
question. IQ tests are famous for this type of problem.

In the college area, and especially in the lower level everyone-takes-this
course that has a 200 student class, the multiple choice, electronically
graded exam is the only way you could expect to get a result back in a
reasonable period of time.

Its interesting, Ken. Of all the calls listed above, I think that
the call you actually got is the best! At least, from the
point of view of cw contesting, your call is clearly best.

When I got my novice ticket in the mail I was very surprised and happy to get not only my license but what I thought was a pretty neat call, KB2GLO. I am now General licensed and plan on getting Advanced soon. I really like my suffix but often think I'd like to get a shorter call for contesting... I even like the rythm of it in code. I don't know maybe I like it because it's mine and I've heard it so often that to me it just seems to bounce along, and no body ever got it wrong on CW. On voice though it seems alot of people think it's KB2GLL. This even happens on the 2 meter repeaters. I just find that I try to say LO more distinctly but for some reason new contacts sometimes thinks it's LL this has happen sometimes even when I gave the standard phonetics. Some people just don't get it until I tell them the suffix is like GLOW. I guess it works both ways. I mean there are some calls that are fine on CW but are harder to copy via voice!

I found this in comp.dcom.telecom:

From: moscom!de@cs.rochester.edu (Dave Esan)
Newsgroups: comp.dcom.telecom
Subject: Joined Countries
Message-ID: <8172@accuvax.nwu.edu>
Date: 23 May 90 15:06:56 GMT
Organization: Moscom Corp., E. Rochester, NY

The Yemen Arab Republic (country code 967) and the People's Democratic Republic of Yemen (country code 969) announced recently that they will merge and form a new country called (surprise) Yemen.

Has anyone heard or thought of what will happen to the country codes? Will they merge into one, or will the North still be 967 and the south be 969?

When Tanganika (255) merged with Zanzibar (259) to form Tanzania they kept both country codes. Of course, Zanzibar, an island, is physically removed from what was Tanganika.

Does anyone know the intentions of the soon to be united Germanys in regard to dialling patterns to what is presently East Germany (DDR), and which will soon be part of a single Germany?

Thanks.

 -->   David Esan   {rutgers, ames, harvard}!rochester!moscom!de

----

Does this mean that 4W or 7O is going away? Gee, and we're probably going to lose one German prefix, too. We've got to put a stop to all this global gemutlichkeit before we wind up with only two or three countries on the DXCC list. :-) :-)

But seriously, anyone know what the scoop is on this one?

Patty

Hold on, Bob.  Don't give up yet!  I have a pageboy II tone and voice that
has been *squelched*.  Give me a few days to round up the mods (not real
convenient, but workable) and I'll blast them off to you by USnail.

Radio-Electronics had an article on building a laser PS -- about a year ago, I think. They gave pretty complete specs, including the core for the transformer, as I recall, and also gave (as usual) a place you could buy the parts. Usual disclaimer: I haven't actually built it...

When I was a teenager living at home, I was not even permitted an antenna outside of my basement bedroom. So I built an 80 meter helical whip on 3 feet of 3/4" dowel with 14" of copper out the top. It's useful bandwidth was about 10khz. but it loaded and I got 579 from a couple hundred miles with 75 watts (DX-60) from the basement .... part of the fun of Ham Radio is experimentation, try various antennas where and when you can build them. One of these days I will get something like a beam and tower. But in 15 years of activity in

Ham Radio ... I have had lottsa fun!!!

>Should be a legit Advanced call, no?

This reminded me of a cute story told to me by a friend who happens to own WA6OOO. Darrel was driving up along highway 101 between Santa Barbara and San Luis Obispo some number of years ago in his old beat-up orange VW station wagon. Darrel has had call plates on this car for quite awhile...Anyway, he's minding his own business and obeying the speed limit(probably no choice on that count ;-) and a CHP officer decides to pull him over.

The officer walks up to him a says in an alarming fashion "Mr., I hope you have a registration to match that license plate of yours!" Now at this point it would help if you all knew Darrel just a little bit...he's got just a bit of the Devil in him...he knew this and had been waiting for the setup for YEARS. He just smiled at the officer and said "Of course I do officer" and proceeded to reach into the glove compartment and fetches the registration then hands it to the CHP officer. The cop walked away from the car scratching his head to go run the registration...Darrel was thoroughly enjoying the cop's consternation...The cop's confusion stems from the fact that in California at the time trailers were issued a 2 letter, 4 number series....like wa6000.............
I gather it took the officer a while to call in the license plate correctly and Darrel didn't offer the officer any help either.
Finally the officer came back up to him and asked "Why didn't you

tell me it was a ham license plate?!?" Darrel just smiled again
and said "Youd didn't ask."

My "Elmer", W6ATJ, had a great call. didah Dah! DIDAADAAADAAAAAHHH!!!

Then there's a big gun DXer in San Francisco whose call is W6AWT- I don't know
if he's still around or not- anyway he liked to stretch out the "T" to make
sure everyone got it right- didah didadah DAAAAAAAAAAAAAAAAAHHHHHHHHHH!! The
guy had such a hairy signal that I could I can still envision the white-hot
PP 2000TH plates and the neighborhood streetlights dimming in synchronism
with his keying.

I worked a guy in the '50's whose call was K6ESE. dit dididit dit. I
wonder how many people wanted to add a "didit" to the end of that call.

Only dyed-in-the-wool CW freaks like myself can appreciate this type
of humor...

Gee, why limit the discussion to US calls? There have been some great ones out of Central and South America over the years. The best one I can remember was 6E5EBE. 5H3TW in the last ARRL DX contest was a fun one too, at 40 WPM. A friend of mine (who shall go nameless) thought he had worked Haiti on 5 bands instead of Tanzania ...

Speaking of sending CW, how many of you in net-land had a chance to work W4KFC when he was alive? Now there was a guy who knew how to send code ... and knew how to operate, too.

I'd guess Bob Parnass might know the answer to this ....

When President Bush was here in Austin last week I cranked up my BC-210, R-7000, and MX4000 to listen for possible secret service/Air Force-1 activity.

Question:
Much to my surprise I found a local AM radio station (KLBJ-AM) using 407.750 MHz as studio-to-remote director's link. 407.750 MHz is also one of the White House's secret service freuquencies...WHAT GIVES?

Incedently, I found the Ex-presidential detail frequency of 165.212 MHz was the only activity in town. Probably covering Lady Bird Johnson.

The AF-1 phone patch frequencies were silent but later I found out that Bush had taken a helicopter to Austin from Houston so AF-1 never landed in Austin hence no AF-1 activity.

Funny what you can learn when the President comes to town!

Here is some help for new mininec3 users who don't have the manual...

Segments - you need to tell it, for each wire, how many pieces to break it up into for the computations. In general, the more segments, the better the accuracy, the slower the computations. You should typically use an even number of segments.

Pulses - pulses are assigned to portions of the wire based upon the number of segments. Chose the pulse (for source or load) based upon the endpoint coordinates for each pulse. (Look at the geometry output). The pulse will be applied to the middle.

Source pulses are how you feed your antenna. the assigned pulse number located where you want to feed it is the source pulse number. Normally chose a voltage of 1 volt and a phase of zero degrees

Load pulses - these would correspond to loads such as traps, resistors (as in a rhombic), etc. You normally don't have theses.

As an example, take the following wire: (remember - dimensions are in meters....)

```
0    -5.277   10       5.277    0    10
```

This would be (roughly) a 20 meter dipole at 10 meters high. The program will compute the connections based upon the coordinates.

chose the frequency (say 14.2 Mhz).
enter the wire and specify 10 segments
use a diameter of, say, .002 meters

Note that pulse number 5 cooresponds to the middle of the antenna.
(obained from the mininec3 geometry report)

specify pulse 5, 1 volt, 0 degrees for the source
specify zero load pulses

Tell it to compute currents.

I got an impedence of (77+J40) for this run.

Tell it to compute far field patterns,.....

The key is to run it once, with output to disk or printer to get the antenna geometry and pulses, and then to run it again once you know this info (scrolls by much too quickly)...

A handy aid it to use mnpre to pre format input for mininec3 based upon file input. Remember that mnpre takes a xxx.NEC file and generates a mininec.INP file (you lose the xxx part), and mininec3 will *not* ask you for geometry input if it finds the MININEC.INP file laying around.

The format of the mnpre file is:

```
GW,,pulses,x1,y1,z1,z2,y2,z2,diameter
```

with a line for each wire.

thus, the TEST.NEC input file for our sample run would contain the following line:

```
GW,,10,0,-5.277,10,5.277,0,10,.002
```

Now, part two of the series answers some common questions and hopefully fills in all the gaps.

------Real questions and answers follow-----------------------------------

> Fantastic, all is approaching elightenement.

I always get worried when that happens.....
>
> Only minor problem is that if I have a "bent" wire, such as an
> inverted-Vee, do I put that in as TWO wires which have a common end - does

yes. Anything that isn't straight has to be broken into discreet straight wires.

> MININEC assume wires with coincident (X,Y,Z) are in fact connected?
> And if they are in fact insulated, do I just specify slightly different
> (X,Y,Z)s ??

yes, and yes.

> Doesn't feel right cos it seems too easy! Will try it in a second! ...

> I think I am getting my orientation in free space confused ... which only
> matters when there is ground --- and when I visualise
> ZENITH   AZIMUTH   VERTICAL   HORIZONTAL

For the coordinate system, imagine you were looking at the antenna.
X would be a distance along the ground pointing at you; Y would be a distance along the ground pointing 90 degrees from X, and to your right; Z is the altitude above ground.

For Zenith, imagine your hand pointing straight up at the sky. Then rotate your hand towards the horizon, say 10 degrees. This is a zenith angle of 10 degrees. Thus, the horizon is at 90 degrees. (I looked at alot of strange pattern plots until I figured this out).

For Azimuth, the angle is the angle between the X axis and a ray rotating towards the Y axis (looking down from the (0,0,Z) axis, it rotate counter clockwise).

```
         Z

         |
         | <phi>/ Q
         |     /|
         |    / |
         |   /  |
         |  /   |
         | /    |
         |/     |
         .______|__________________ Y
               / \     |
           /   \    |
             /     \   |
         /       \  |
        /         \ |
       / <theta>   \|
      /_____________\
     X
```

where theta is the azimuth angle ane phi is the zenith angle.
Rotating away from Z towards the point Q is positive zenith angle.
Rotating away from X counter clockwise is a positive azimuth angle.

Part three concerns connections. While mininec3 will automatically compute connections for you, you should check it's geometry output to ensure that YOU didn't make any mistakes. You can do this by checking the connection data of the geometry output.

A connection value of

zero indicates that the end of the wire isn't connected to anything (*yet*).

a negative integer with a magnitude equal to the wire number indicates a connection to ground

a negative integer with a magnitude less then the wire number indicates a wire junction. Specifically, it indicates that this end (end1 for example) is connected to the same end (end1 again) of another wire. For mininec3 this number should be the wire number of the previously defined wire that this wire connects to.

a positive integer with a magnitude less then the wire number indicates a wire junction. Specifically, it indicates that this end (end1 for example) is connected to the other end (end2 for example) of another wire. For mininec3 this number should be the wire number of the previously defined wire that this wire connects to.

I complemented this by writing a script that takes .NEC files and display's them with xgraph. Most errors show up right away!

The demand for help hasn't been swamping me, so I'd be glad to help people get started (I'm not an expert - I just have the manual!) I've been having luck with X-beams and V beams, but a friend has been having trouble with "parallel" dipoles.
Play with it!

Hope this gets you started - good luck!

I had a Novice license at age 6 in 1963......had my picture in QST and everything (KN3ZIM). Doug is right --- it was basically rote memorization without understanding the concepts. Thinking back, I remember it took a lot of cajoling from my (well-meaning) parents to even sit down at my little station (Hallicrafters SX-140 and HT-40....no VFOs then). Only made a few contacts, and once the license expired (1 year term, nonrenewable) I let the stuff gather dust. Outside of a brief nerdish encounter with the hobby as a 2 Meter lid [my term, not an indictment of everybody on VHF, so no flames please] during the mid '70s CB craze I haven't been on the air (or wanted to be) for a long time.

Don't push kids....it's just not worth it.

M. Baker

Though not a precise answer to the above, here in 2land, I went down to the NYC FCC office and passed my Tech test (had no license before), in the summer of '76. Got issued WA2ISE, which had been used before. Once looked for and found the previous user in an old callbook. Someone in upstate NY.

If I should ever get around to learning 13wpm and get a general or advanced (I'd take the advanced test anyway), I'll still keep my current call. I like W's. and also, when I tell ordinary people about amateur radio, and mention my callsign, people can relate it to the local broadcast radio stations, as

both begin with W. Though the two services are much different, the similarity of the calls helps establish that amateurs are a radio service, and not some sort of phone modem computer thing, etc. More obvious than if I had an N, K, or A call. (I would like to see a broadcast station "NERD" :-))
(anyone get assigned N3RD :-))

My pal John and I have been hamming together for years. Back when he was N7COV and I was WA7CSK, we used to enter contests together at each other's stations.

This all changed, at least on CW, when we got new calls.

Now he is NT7S, and I am KT7H. Imagine being either one of us, and
going to the other guy's station to operate a CW contest.

My call:

-.- - --... ....

His call:

-. - --... ...

Mine has one more dah on the front and one more dit on the end. We have
real problems getting used to sending the other guy's call on CW!

WWVB references
----

1. "A WWVB 60 kHz Frequency Comparator Receiver" by Ernest P. Manly,
_73_ Magazine, Sept. 1972. The now-obsolete RTL integrated circuits
in this design can probably be replaced with CMOS. It's similar in
function to the Hewlett-Packard 117A VLF Comparator but has no phase-

locked oscillator output.

2. Don Lancaster published plans for a 60-kHz WWVB receiver with time-code output, in _Radio-Electronics_, August 1973, p. 48. Methods of phase-locking are discussed. Article includes time-code format.

3. "Low-Frequency Receiving Techniques," a series of articles by R. W. Burhans in _Radio-Electronics_, March-July 1983, describes state-of-the-art LF/VLF active antennas, and a method for using LORAN-C (100 kHz) for time and frequency calibration. A set of reprints, with errata/addenda, is available from the author for $4.00:

Burhans Electronics
161 Grosvenor St.
Athens, Ohio 45701

Send SASE for catalog. See also Prof. Burhans' three-part article about Omega navigation receivers (10-14 kHz) in _Byte_ magazine, February, March, April, 1977.

Does anyone happen to have schematics to do such a thing? The only one I've ever seen was a pre-fab and too expensive. I think it was a Heathkit. It had a built-in clock for when it lost RF, so it would still be able to keep time.

Thanks,
L. Scott Emmons

Okay, here's one that I've started noticing recently. In my car I have a radar detector (Whistler 425) on the visor, and I usually also have my 2m HT (IC-2GAT). When I key up the HT, the radar detector will frequently start falsing. This happens occasionally when the HT is using the rubber ducky & 1 watt output. It's more regular when running high power (7W) with either the ducky or the 1/4 wave mag-mount on the roof.

Yesterday I installed a RF Concepts 2-23 power amp, and the >30W output to the magmount will regularly set off the detector, reading about a half-scale alert.

Has anyone else run into this problem? If this is front-end overload on the part of the radar detector, is there anything that could be done? Obviously, putting the detector into a Faraday cage is not an acceptable solution... :) Another note is that this *does* happen when the HT is running off of battery and is not connected to the amp.

Any and all ideas regarding this problem would be appreciated.

In article <30500546@ux1.cso.uiuc.edu> phil@ux1.cso.uiuc.edu writes:
>And what how are these bits encoded? I means thinks like which seconds
>of the minute cooreспond to which data item, etc? And what is this
>"other junk"? Anything useful?

I'll bite, since I once typed this in for another reason and still have a copy. For your edification the WWV(H) time code is included as well. You can actually decode the latter by ear if your short wave receiver's audio section will give you enough bass to hear the 100 Hz.

WWVB drops carrier power 10 db at the beginning of every second, and stays down for 200 ms for a 0 bit, 500 ms for a 1 bit and 800 ms for a marker. WWV(H) transmits a 100 Hz subcarrier which begins 30 ms after the on-time second (except for second 0, where the pulse is omitted) and remains on for 170 ms for a 0 bit, 470 ms for a 1 bit and 770 ms for a marker. (m)'s in the table indicate markers, while unused bits are transmitted as 0.

Note that this all comes from my copy of NBS special publication 432, which is old. WWVB has recently been upgraded to include, in addition to this, the year-of-century and a leap second warning bit in the unused bits at the end of the minute, but I've misplaced the note concerning where the new bits are actually located (I think the year is sent during seconds 45-48 and 50-53). WWV and WWVH were also to be modified to include this information but the company building the new time code generators went out of business. They are still tendering for bidders to do this, if anyone is interested.

The WWVB format is essentially IRIG-H, which is a standard time code format for laboratory use. The WWV format is unique.

The Rode-PC data entry package requires these gadgets. It's one step better than copy protection, but I did have one fail and had to return it for replacement (it was free, but the package was dead until I got the new one.

I suspect that there is a state machine in the dongle, that looks at sequences of bytes sent, until it is satisfied, then returns a pattern on the parallel port status input lines. Since the printer still works, the Rode package must be sending bytes out WITHOUT the data strobe (I assume this is possible, but haven't a programming reference nearby). Perhaps one data bit is used as a strobe. Someone with a data analyzer could probably figure out the sequence.

Two questions on Motorola HTs.

What is list price for the VHF HTs with Antenna, Belt Clip, AC Adapter, NICAD, & Charger.

What is a good selling price for these?

And (woops) a third question, what is the Green-Dot Freq?

Thanks,
Lance Ware

In a previous article, TCOMGRD1@OUACCVMB.BITNET writes:
>Whats the diff between baud and bps [bits per second]?

Bits/second is just what it sounds like, the total number of bits transmitted each second. Baud is a term that can be also read as 'symbols per second'. Since a symbol can be either 1 bit, 2 bits, 3 bits, 4 bits, or more, you can vary the bits/second and still have the same baud rate. If there is only 1 symbol/second, then the bit rate and baud rate are the same number. Usually, the number of bits/symbol is an integer, but it doesn't have to be. A symbol time is the rate at which data is truely transferred on the carrier. The It is up to the equipment at each end to encode the proper number of bits in each symbol and to recover them on the receiving end. For QPSK (Quadrature Phase Shift Keying), there are 2 bits/symbol. For BPSK (Binary Phase Shift Keying), there is 1 bit/symbol.

One of my favorites is the shortest CW call in the US, N5EE, whom I've
worked in contests (no, he doesn't send RST 555), although since the call
sign restructuring, this call is of course matched by NE5E.

I once operated Nov. SS from a club station using another member's call,
KR2B. THAT was tough....

I have recently purchased a DX-440 radio from Radio Shack.  I would like to
```

receive the station at 10863 KHz. I seem to have antenna problems (not enough gain) for this signal. What is the best way to go? Right now, I have a 35 ft piece of wire soldered to the center conductor of a coax cable (not sure if it is 50 ohm or 75 ohm. Does it matter?) and have the shield of the coax soldered to a piece of copper braid 1/2 wide (I use solder-wick) and have the braid attached to a cleaned water pipe just before it goes into the ground next to my house. Is this kosher? The antenna I have made doesn't seem to work as well as the built-in antenna. How can I improve this? My questions are:

1) Should the longwire antenna be mounted horizontally or vertically for best performance?

2) Is there some method to better match impedances for the long wire? (What is the impedance of a long wire?)

3) Radio Shack sells an antenna kit for this radio. Is this worth purchasing?

4) What other tips and techniques could you suggest?

I hope not, since there *won't* be ATV on STS-35. Only packet and voice will be available; the TV (SSTV and FSTV) equipment is too bulky to fit in the (severely limited) space available for this mission.

Assuming all goes as planned, STS-37 (scheduled for November, if memory serves) will include two-way SSTV and *uplink only* FSTV capability, along with the usual voice and packet.

Actually, the content of the traffic is probably the lesser concern. The greater concern is that no third party can initiate amateur transmissions without the participation (monitoring) of a licensed ham. Effectively, this means that *all* traffic in the Internet-to-packet direction has to be read by a ham before it is allowed to be transmitted. This isn't a gray area, by the way, in spite of the flaming you may hear to the contrary. It is perfectly clear in Part 97, as I have confirmed by discussing it with Perry Williams, the ARRL lobbyist. Much as I would *love* to see gateways of this sort, it just isn't legal to have an automatic relay from Internet to packet.

Of course, if hams could develop a track record of operating attended (monitored) gateways and show that the traffic flowing through them is benign, who knows? Maybe eventually we could have legal automatic gateways, Internet willing. The trick is to convince the FCC that there is very little opportunity for misuse of the network, particularly by criminals and the like. (You may think I'm kidding about the criminals; I'm not. A few weeks ago W4RI and I gave a packet briefing to several of the FCC staff in Washington, and it was quite obvious that the question of how to identify the originating station of a message was one of their top concerns. Perry later explained to me that they are worried that the ability to send data that isn't monitored by anyone could be used by druggies to establish communications for their illegal activities. Personally, I would think that there are better options for the illegals to use.)

Sure it's legal. They are simply operating a station under remote control. Nothing wrong with that at all! The fact that the equipment is at your QTH is irrelevent; this was dealt with a couple of years ago when the FCC ruled that it was OK to use your own call sign regardless of the fact that you may be at the location of another licensed station. (As I recall, the question originally came up at about the time handhelds became popular :-)

Many of the older synthesizers required a little readjustment of the PLL voltage control once the frequency was "opened up". This control is most likely a inductor or capacitor located in the (typically) shielded PLL module. The adjustment hole may be covered with a small sticker. I'll try to Email the details to you if I have them. Also, I remember an article (actually several) in 73 Magazine on the mods to this radio. In particular, there was one written about early 80s by Robert Morrow in 73.

Basically, you slowly tweak this control until the radio unlocks just below the lower desired frequency limit. Then you end up with the upper edge as high as it will go; for the IC-02A, typically 163 MHz.

>
> If anyone has information on how to move the frequency of this signal, PLEASE send me email.

Well let's see...the 41st harmonic of 3.579545 MHz (Apple II clock divided by 4 and also the NTSC chroma burst frequency) just happens to be 146.761 MHz. IF your neighbor doesn't use an NTSC color monitor (i.e. doesn't use composite color video output) then you might be able to change the AII's 14.31818 MHz crystal to 14.320 MHz with hopefully no bad effects. The new frequency of 14.320 MHz will give a birdie at 146.780 MHz which should be out of your receiver passband.

An even BETTER thing to do is to STOP the Apple][from radiating! Try ferrite cores an all wires leaving the unit. IF the Apple II is really old it will NOT be class B certified.... however the newer Class B FCC certified Apple II should not be radiating all the way from your neighbor's house if it is properly configured. Also on the Class B FCC certified Apple II's there is a flame-spray zinc coating on the enclosure underneath the paint. There are unpainted spots where the lid is supposed to contact the rest of the case to form an RF tight seal. This, along with various ferrite beads on the mother board, were some of the steps taken to get the original Apple II to pass FCC Class B standards.

If your neighbor has a very old Apple good luck!

-C.T. WB4HVD

p.s. if your neighbor uses an RF modulator and a color TV
you will not be able to change the crystal freq without
blitzing his colors :-(.

Sorry for continuing questions, but the advantaging of usenet and internet for finding out things quickly does not work well for stuff that refers to other stuff I don't have.

First questions, is: does the minute/hour/day specified refer to the exact minute just past or the one coming up? The remaining questions refer to some bits below:

```
>               m  0
>            | 40  1
>            | 20  2

|
| Some of the above reply is not quite correct. The NBS (now NIST)
| transmits HF time signals on 2.5, 5, 10, 15 and 20 MHz from Ft. Collins,
| CO (WWV) and Kauai, HI (WWVH, omits 20 MHz). They also do indeed transmit
| a time signal on 60 kHZ (WWVB, in Ft. Collins, CO). WWVL was a 20 kHz
| station at the Ft. Collins site but was shut down 20 years ago. In
| addition to this, NIST transmits a time code on the interrogation
| channel of the GOES satellites, this at slightly above 468 MHz. All
| this is from NBS Special Publication 432.
|
| While the WWV(H) time signals are certainly very accurate as transmitted,
| HF signals propagate by F-layer skip which means the transmission path
| length will vary somewhat unpredictably from day to night, summer to
| winter, and with changes in solar activity. The time you receive will
| thus jitter by something on the order of several milliseconds. Also,
| since HF propagation is fairly unreliable, you will need a reasonably
| stable oscillator backing the receiver for periods when the time signal
| is unreceivable.

|
Isn't time information available via C band satellite (TVRO)? I know
that CHU is available on Anik D1 (when the Canadian parliament is not
in session), and I seem to recall details of other time standard broadcasts
available via satellite. Unfortunately, I don't have any specific
information.

Actually, it was simply recognition of the fact that hams have always considered their callsigns to be personal identifiers, rather than station identifiers, and have always used them as such. Even the people who bothered with using the club call always added "W6xyz at the mike".

As for coming up about the time handhelds became popular, well... Let's just say it was about the time handhelds became popular in Newington. The rest of us had already been using walkies for about 10 years or so.

Phil,

No trouble. WWVB's time code refers to the time at second 0 of the minute, i.e. the on-time minute just past. UT1 is the astronomical time scale, defined by the position of things in the sky, while UTC is the time scale defined by the cesium frequency standard. DUT1 is UT1 - UTC. Leap seconds are inserted into UTC to keep it within 0.6 or 0.7 seconds of UT1 Since the earth is currently running slow compared to the atom, DUT1 starts off positive after a leap second and drifts negative. When DUT1 reaches -0.4 or -0.6 or so, they add a leap second to UTC to make it positive again.

The leap year bit is indeed set during leap years. This is to help radio clocks do day-of-year to month/day conversions (note that the year was included in the time code only recently, so a radio clock couldn't determine what year it was and hence couldn't convert to month/day without knowing the state of this bit). WWVB returns UTC, so the DST bit doesn't affect this, but it does help radio clocks which display the time in a local timezone.

Dennis Ferguson

> By the way, aren't there restrictions on the types of things which can be
> posted on some machines in the internet? Like advertisements?

Yes. However the specifics vary from network to network, and do not happen to be exactly the same as amateur radio. To start with, the amateur radio service restrictions originate in federal regulations whereas the restrictions on networks originate in many other places and in different forms. There can be specific policy (e.g. Dod for Arpanet) and implied or specific policies from funding sources. You may even be able to find things that are legal and accepted over ham radio and are technically against the policy of a network.

> One of my favorites is the shortest CW call in the US, N5EE, whom I've worked in contests (no, he doesn't send RST 555), although since the call sign restructuring, this call is of course matched by NE5E.

And AE5E.

And back in '83, when I first began working at JPL, one of my co-workers was AE6S. My call at the time was WA6IRH, but I was quite inactive; however, when I discovered his call and learned that there were more weird ones like that to be issued, I got to work on my code and on 18 Nov 1983 I received my new call. However, I had really hoped to avoid the two letters of my old callsign that I least liked: W and H. Of course, the FCC knew this and cursed me with them again... It can be a very confusing call on voice: the N is nearly the equivalent of an "uhh" and so the call is copied as W6H? . Of course, then there was XE2CCC who never was able to figure out my call one evening on 40m. I turned off the radio and went to bed. Yeeesh.

There are a number of considerations to be made when using Radio for timing signals. First you have the source. This can be WWV broadcasts, Loran C navigation signals, or whatever happens to be handy. Next you need to consider path length and path route. Radio waves travel faster over water. For high enough accuracy, the path length needs to be determined within 5 meters. This is about the best you can do as far as timing precision. I do have anything detail on this handy, but these type of systems cost in the 10K range. I can get more information if anyone is interested, but I don't know who's question this was.

Shouldn't be any more of a problem legally than if someone breaks into
your home and dinks around with your station on the air....as long as
you have taken some precautions to provide a reasonable amount of
security, you shouldn't be held liable.
>

This should be the same as you giving your house key to your licensed ham
friend, who then comes over and operates your station when you are not
around. No problem, as long as you take reasonable precautions.
